That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Subject: Info Syntor X radios

I need some information on several Syntor X radios. These radios are programmed for the 154.00 public service band.
1) Is it possible to reprogram these radios for 2-meter?
2) What type of equipment is required to program them?

All of the ID numbers are identical except for the serial #'s.
tx: CC3372 ID: T73VBJ7D04BK
rx: RC0291 MOD: T99VB+008W

Any information you can provide about these radios will be greatly appreciated.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of

experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: Need Ten Tec SCOUT555 info

Does anybody have or know about SCOUT-555 inexpensive mono band transceiver from Ten Tec? Please let me ask you a couple of questions.

1.What sort of circuit is in a band module? The band module is the one you have to pull out and push another one into the transceiver to change the band.

2.Would it be possible to build the band module by yourself?

Thanks in advance,

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the limited output power - even with an external antenna on a car I have difficulty getting reliable QSOs thru repeaters. I am looking at buying a "brick" amplifier to get round this. The other restriction is the audio

output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on climbing trips and use in hotel rooms when travelling. Sure there is no autopatch capability, but look at the size and price! The scanning capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220 repeater and my 2m HT, I have to wait for the 220 repeater to drop before I can transmit. This becomes a real drag when on a roundtable on the 220 repeater and it has a long hang time. Is there anyway around this? Is there a way to make the 742A act like a single frequency repeater on the 2m side (ie. sample the receive every few hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

From: swdecato@nps.navy.mil
Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper
battery connection. I'm just wondering if I could get the thing to work on
2 meters.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

>Dave Comer (Waiting on the FCC)

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

I have a 733 and I'm very happy with it. I have a dual band handheld
and I use the cross band repeater function in the 733 often. I have
it mounted in a manner similar to yours and that's why I purchased
it.

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically
tally's DXCC and WAS by band, by mode. Has default settings for power-up (I
enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option
allows me to store long/lat data of my qth and shows the lp and sp and distance
to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says
"less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I
still am using the HYPERLOG software. No, I have no affiliation with Hyperlog
in any way. A friend in JA introduced me to the software after trying

something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

> not result in any further increase in RF output.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to

show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the
limited output power - even with an external antenna on a car I have
difficulty getting reliable QSOs thru repeaters. I am looking at buying a
"brick" amplifier to get round this. The other restriction is the audio
output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on
climbing trips and use in hotel rooms when travelling. Sure there is no
autopatch capability, but look at the size and price! The scanning
capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220 repeater and my 2m HT, I have to wait for the 220 repeater to drop before I can transmit. This becomes a real drag when on a roundtable on the 220 repeater and it has a long hang time. Is there anyway around this? Is there a way to make the 742A act like a single frequency repeater on the 2m side (ie. sample the receive every few hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

JAN offers very cheap crystals, but they frequently don't work! I bought about a dozen JAN crystals for some 6-meter channel elements. When they came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I had no faith that the working ones would continue to do so.

Subject: Need MOD for ICOM T21AT

Hello All;
I just got an ICOM T21AT 2M HT through a trade. The extended RX was done
by the keypad. How about the TX? Does anyone know of the TX mod for this
HT? BTW What is the full freqs coverage for this thing?

From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper
battery connection. I'm just wondering if I could get the thing to work on
2 meters.

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

I have a 733 and I'm very happy with it. I have a dual band handheld
and I use the cross band repeater function in the 733 often. I have
it mounted in a manner similar to yours and that's why I purchased
it.

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically
tally's DXCC and WAS by band, by mode. Has default settings for power-up (I
enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option

allows me to store long/lat data of my qth and shows the lp and sp and distance to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says "less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I still am using the HYPERLOG software. No, I have no affiliation with Hyperlog in any way. A friend in JA introduced me to the software after trying something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Subject: Info Syntor X radios

I need some information on several Syntor X radios. These radios are programmed for the 154.00 public service band.
1) Is it possible to reprogram these radios for 2-meter?
2) What type of equipment is required to program them?

All of the ID numbers are identical except for the serial #'s.
tx: CC3372 ID: T73VBJ7D04BK
rx: RC0291 MOD: T99VB+008W

Any information you can provide about these radios will be greatly appreciated.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of

experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: Need Ten Tec SCOUT555 info

Does anybody have or know about SCOUT-555 inexpensive mono band transceiver from Ten Tec? Please let me ask you a couple of questions.

1.What sort of circuit is in a band module? The band module is the one you have to pull out and push another one into the transceiver to change the band.

2.Would it be possible to build the band module by yourself?

Thanks in advance,

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the limited output power - even with an external antenna on a car I have difficulty getting reliable QSOs thru repeaters. I am looking at buying a "brick" amplifier to get round this. The other restriction is the audio

output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on climbing trips and use in hotel rooms when travelling. Sure there is no autopatch capability, but look at the size and price! The scanning capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220 repeater and my 2m HT, I have to wait for the 220 repeater to drop before I can transmit. This becomes a real drag when on a roundtable on the 220 repeater and it has a long hang time. Is there anyway around this? Is there a way to make the 742A act like a single frequency repeater on the 2m side (ie. sample the receive every few hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper
battery connection. I'm just wondering if I could get the thing to work on
2 meters.

I was just making "guesses and assumptions" as my first suspicions.
What you suspect has been suggested to me in several Email messages I
received from other members of the group. I have gotten some good leads
to look into. I plan to check it out as soon as I get some time.

To everyone, I appreciate all the help and suggestions that were made.

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

I have a 733 and I'm very happy with it. I have a dual band handheld
and I use the cross band repeater function in the 733 often. I have
it mounted in a manner similar to yours and that's why I purchased
it.

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically
tally's DXCC and WAS by band, by mode. Has default settings for power-up (I
enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option
allows me to store long/lat data of my qth and shows the lp and sp and distance
to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says
"less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I
still am using the HYPERLOG software. No, I have no affiliation with Hyperlog
in any way. A friend in JA introduced me to the software after trying
something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess

High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts

>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need

some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Subject: Info Syntor X radios

I need some information on several Syntor X radios. These radios are programmed for the 154.00 public service band.
1) Is it possible to reprogram these radios for 2-meter?
2) What type of equipment is required to program them?

All of the ID numbers are identical except for the serial #'s.
tx: CC3372 ID: T73VBJ7D04BK
rx: RC0291 MOD: T99VB+008W

Any information you can provide about these radios will be greatly appreciated.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the
limited output power - even with an external antenna on a car I have
difficulty getting reliable QSOs thru repeaters. I am looking at buying a
"brick" amplifier to get round this. The other restriction is the audio
output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on
climbing trips and use in hotel rooms when travelling. Sure there is no
autopatch capability, but look at the size and price! The scanning
capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz
from a 12,000 ft mountain in Yosemite National Park - about 150 miles -
all on the 3 inch long antenna! Also used it in the UK a couple of weeks
ago - the C-508A built-in 1750 tone capability is needed to access British
repeaters.

Let me know if you need more info.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much.
However, I do have a couple of questions that I can't seem to find the
answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the
autodialer memory number (#1 in my case). The transmitter turns on when
the PTT is pressed, of course, but then turns off when the PF button is
pressed and then back on for the DTMF string. However, there is no (or
very little) pause between the transmitter turn on and the sending out
of DTMF. I use two repeater autopatches and neither of them likes this
and it _usually_ results in a misdial. Question: Is there anyway to
add a pause or a brief wait between the transmitter turning back on and
the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220
repeater and my 2m HT, I have to wait for the 220 repeater to drop
before I can transmit. This becomes a real drag when on a roundtable
on the 220 repeater and it has a long hang time. Is there anyway
around this? Is there a way to make the 742A act like a single
frequency repeater on the 2m side (ie. sample the receive every few
hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I

had no faith that the working ones would continue to do so.

From: Bill <Bill@survival.demon.co.uk>
Subject: Regulations Shortwave Transmitter/Receiver must fullfill (help)

A UK based charity has developed a pedal powered generator to operate a short-wave transmitter/receiver working at (4.005 MHz). The use is to supply village to village communication in Tanzania Africa. A small pilot project has successfully run for the last 12
years with commercial bought in equipment. The aim is to manufacture pedal generators and short-wave transmitter/receivers locally in Tanzania both to save foreign currency and provide
local employment.

A transmitter/receiver has been designed and 95 per cent completed.

Does anyone know what international regulations such a short-wave transmitter/receivers would have to comply with? The project is based in the UK.

Thank you for any help anyone can give.

Bill

Butch, It shouldn't be that hard to put in an aftermarket tone board.
The factory board will only let you set it up for three different
frequencies, if I remember correctly. If you only need one frequency,
I would look at one of the miniature tone boards that Communications
Specialists sell. They are available from a lot of the mail order
places. They are very simple to hook up. The original factory tone
board plugged into a small plug on the 7950. My guess it was a B+,
GND and tone into the radio line. Even if it is not, you can call
Communications Spealists and they will tell you where to connect their
boards on most radios. I hope this helps....73's Floyd WD5ENJ

From: wright@onramp.net (jeff wright)
Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of
those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

Regards,

jeff wright

Date: 29 Aug 1995 20:58:04 GMT
From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

From: swdecato@nps.navy.mil
Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper

battery connection. I'm just wondering if I could get the thing to work on
2 meters.

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later

this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed

the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

I have a 733 and I'm very happy with it. I have a dual band handheld
and I use the cross band repeater function in the 733 often. I have
it mounted in a manner similar to yours and that's why I purchased
it.

>Tom

Hi Tom, I too have tried several computer logging programs. I assume you are interested in the casual day-to-day logging, not contest logging. For casual daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I believe
version 2.24 was a "testware" program that allowed free testing for a period of time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before, date, time, band, etc. Shows QSO's with that country before. Automatically tally's DXCC and WAS by band, by mode. Has default settings for power-up (I enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option allows me to store long/lat data of my qth and shows the lp and sp and distance to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says "less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I still am using the HYPERLOG software. No, I have no affiliation with Hyperlog in any way. A friend in JA introduced me to the software after trying something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

> not result in any further increase in RF output.

This is because the radio has a feedback circuit which measures the power
output (actually it often measures the RF voltage output), and adjusts the

RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only
from California...

The last U-Haul I rented had binding posts on the dash with 12VDC
available. I suppose we could tell each other that they did it for the
Ham community, but my real guess is that they got tired of people
butchering the wiring to hook up CB's. I know from several years of
experience in repairing over-the-road trucks that some people will cut
into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the limited output power - even with an external antenna on a car I have difficulty getting reliable QSOs thru repeaters. I am looking at buying a "brick" amplifier to get round this. The other restriction is the audio output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on climbing trips and use in hotel rooms when travelling. Sure there is no autopatch capability, but look at the size and price! The scanning capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220
repeater and my 2m HT, I have to wait for the 220 repeater to drop
before I can transmit. This becomes a real drag when on a roundtable
on the 220 repeater and it has a long hang time. Is there anyway
around this? Is there a way to make the 742A act like a single
frequency repeater on the 2m side (ie. sample the receive every few
hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

Butch, It shouldn't be that hard to put in an aftermarket tone board. The factory board will only let you set it up for three different frequencies, if I remember correctly. If you only need one frequency, I would look at one of the miniature tone boards that Communications Specialists sell. They are available from a lot of the mail order places. They are very simple to hook up. The original factory tone board plugged into a small plug on the 7950. My guess it was a B+, GND and tone into the radio line. Even if it is not, you can call Communications Spealists and they will tell you where to connect their boards on most radios. I hope this helps....73's Floyd WD5ENJ

Paul, removing the battery on external power is about as old as the HTX-202.

Apparently in the first few batches of '202s there was a problem with a diode in the radio that would overheat and fry, so the recommendation was to take the battery pack off to permit better cooling to the bottom of the radio.

Don't know if it is true or not...I just slip an empty alkaline pack on the bottom of the radio and go my merry way. On the '202, there shouldn't be power on the bottom of the radio, but I picked up the habit with ICOM 02ATs and 03ATs, and some habits are hard to break...

My $0.02.

From: wright@onramp.net (jeff wright)
Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of
those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

Our local Radio Shack stores stock only HF SWR meters,

HOWEVER

They were able to order an inline SWR/POWER meter for 2m/70cm. This is
not in our stores but is still available.

Details:
Part number = 10508018
Price = $46.19 which is cost+postage+tax
Time for home delivery = 7 to 10 working days.

Date: 29 Aug 1995 20:58:04 GMT
From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

From: swdecato@nps.navy.mil
Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper
battery connection. I'm just wondering if I could get the thing to work on
2 meters.

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

I have a 733 and I'm very happy with it. I have a dual band handheld
and I use the cross band repeater function in the 733 often. I have
it mounted in a manner similar to yours and that's why I purchased
it.

I wouldn't register Hyperlog anytime soon. Apparently Hyperlog Pro
will be out soon and I don't know that registered users of Hyperlog
will get any break on the new version.

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically
tally's DXCC and WAS by band, by mode. Has default settings for power-up (I
enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option
allows me to store long/lat data of my qth and shows the lp and sp and distance
to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says
"less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I
still am using the HYPERLOG software. No, I have no affiliation with Hyperlog
in any way. A friend in JA introduced me to the software after trying

something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to

show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the
limited output power - even with an external antenna on a car I have
difficulty getting reliable QSOs thru repeaters. I am looking at buying a
"brick" amplifier to get round this. The other restriction is the audio
output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on
climbing trips and use in hotel rooms when travelling. Sure there is no
autopatch capability, but look at the size and price! The scanning
capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

From: rick.edwards@mogur.com (Rick Edwards)
Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220 repeater and my 2m HT, I have to wait for the 220 repeater to drop before I can transmit. This becomes a real drag when on a roundtable on the 220 repeater and it has a long hang time. Is there anyway around this? Is there a way to make the 742A act like a single frequency repeater on the 2m side (ie. sample the receive every few hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

I have had my TM-742A with a six-meter module for almost two
years. The unit is used daily as a mobile rig. Absolutely
zero problems so far.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

From: Bill <Bill@survival.demon.co.uk>
Subject: Regulations Shortwave Transmitter/Receiver must fullfill (help)

A UK based charity has developed a pedal powered generator to operate a short-wave
transmitter/receiver working at (4.005 MHz). The use is to supply village to village
communication in Tanzania Africa. A small pilot project has successfully run for the last
12
years with commercial bought in equipment. The aim is to manufacture pedal generators and
short-wave transmitter/receivers locally in Tanzania both to save foreign currency and
provide
local employment.

A transmitter/receiver has been designed and 95 per cent completed.

Does anyone know what international regulations such a short-wave transmitter/receivers
would have to comply with? The project is based in the UK.

Thank you for any help anyone can give.

Bill

>Butch KF5DE

Butch, It shouldn't be that hard to put in an aftermarket tone board.
The factory board will only let you set it up for three different
frequencies, if I remember correctly. If you only need one frequency,
I would look at one of the miniature tone boards that Communications
Specialists sell. They are available from a lot of the mail order
places. They are very simple to hook up. The original factory tone
board plugged into a small plug on the 7950. My guess it was a B+,
GND and tone into the radio line. Even if it is not, you can call
Communications Spealists and they will tell you where to connect their
boards on most radios. I hope this helps....73's Floyd WD5ENJ

I also have a FT-530 and replaced the stock antenna with a Diamond RH77CA
rubber duck. It is about 14.5" inches long from the base.
It is far superior than the stock antenna. I paid $35 for it at the local
Ham Radio Outlet store. I've seen these at hamfests for around $20.

Subject: Radio Shack 2m HT - Is it a good by for the price?

hdc@netmetro.com (hdc@netmetro.com) wrote:
> I would appreciate your comments on the Radio Shack 2m Handheld
> transceiver.
> I'm a rank beginner with my new tech licence, looking for my
> first rig.

Not to send you off the track of a HTX-202, but I've just heard about
the 4th radio in my county going on the blink. Intermittent transmit.
All the same problem. The latest one is 3 months old. Whenever used
on 12 V. it is on a mobile 5/8 antenna.

True, I don't know how many operators in my county have the HTX-202,
exactly. There are approximately 1300 or so amateurs that live in my
county. I'm sure they don't all own the HTX-202. ;-)

The ones that do work sound good. The owners like them. Just about
every owner that I have talked to has the extended warranty. (And it
is apparently pretty good tha they do have it...)

> Is it a good buy for $260? I notice that they bundle in a few
> options in the
> price, that others don't. Is there a better choice in that
> price range?

Considering the problems that I've heard with this HT, >if it were me<,
I wouldn't purchase it without the extended warranty. Figure another
$40 or whatever it costs onto the price of your HT. Now you're looking
at around $300. Is it worth that much? In my opinion, no.

Now if you get it for the sale price of around $190 + $40 warranty, you're
looking at $230ish. Yeah, maybe it is worth that to someone. Did I
say "Don't buy this radio without the warranty?" Well, if I didn't say it,
be sure you don't buy it without the warranty.

Actually, I think Radio Shack ought to adjust the price of their radio so it includes the price of the 5 year warranty. Of course, others may not think that way... I'm just going by the track record I've seen from locals on this radio...

I must add that Radio Shack has been very good to the locals in the customer service department. They stand behind their product. That is an important consideration when considering a purchase of most anything.

It is reported that the HTX-202 is very good in a high RF environment. It tends to not suffer from intermod interference. This might be something to consider, too.

All in all, I'm pretty neutral on the HTX-202. I probably wouldn't buy one for myself, but I'm not in the market for a 2M HT, either.

Contratulations on your new license and enjoy--

73,
Ken

Message-ID: <DE9G3J.L10@eskimo.com>
Source record: 213035

What good is 6 meters, you ask...

Well, here's some thoughts:

Anything you can do on 6 can be done better on another band. For instance:

1. You can work DX on 6, but you can work lots more on the lower freq's.
2. You can use a HT on 6, but the antennas are more manageable on 2 or 70cm.
3. You can get good gain from a moderate sized yagi, but again, more on the higher freq's for the same $$.
4. If you like working repeaters or packet, etc, 2 meters has lots more activity.
5. Contesting on 6 is for masochists. Long hours, low pay.
6. Groundwave coverage is better than 2 meters, but 10 meters is better yet.

Actually, there is one thing 6 is better at, and that's causing TVI. It is the unquestioned champ, always has been and as long as there's a channel 2, always will be.

And yet, there are those of us who love it.... don't ask me why :-)

From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

From: swdecato@nps.navy.mil
Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper
battery connection. I'm just wondering if I could get the thing to work on
2 meters.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.

- Just remember it's an HT, not a mobile. They generally have intermod problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed the same issue. After talking with older and greyer HAMS, I opted for an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace in Virginia. I've my ICOM programmed for both places, as well as home base in Owego NY. I needed a lot of memory in order to do this. The IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give me unlimited power supply (and 5 Watt transmit as well) and a "hot rod" antenna to help ensure that I "get through" in emergencies.

I have a 733 and I'm very happy with it. I have a dual band handheld
and I use the cross band repeater function in the 733 often. I have
it mounted in a manner similar to yours and that's why I purchased
it.

Hi Tom, I too have tried several computer logging programs. I assume you are interested in the casual day-to-day logging, not contest logging. For casual daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I believe
version 2.24 was a "testware" program that allowed free testing for a period of time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before, date, time, band, etc. Shows QSO's with that country before. Automatically tally's DXCC and WAS by band, by mode. Has default settings for power-up (I enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option allows me to store long/lat data of my qth and shows the lp and sp and distance to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says "less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I still am using the HYPERLOG software. No, I have no affiliation with Hyperlog in any way. A friend in JA introduced me to the software after trying something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection
system, since you described amplitude modulation, not vertical
deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or
earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the
electrolytic filter capacitor may have become defective in its old
age.

> not result in any further increase in RF output.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external

voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only
from California...

The last U-Haul I rented had binding posts on the dash with 12VDC
available. I suppose we could tell each other that they did it for the
Ham community, but my real guess is that they got tired of people
butchering the wiring to hook up CB's. I know from several years of
experience in repairing over-the-road trucks that some people will cut
into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the
limited output power - even with an external antenna on a car I have
difficulty getting reliable QSOs thru repeaters. I am looking at buying a
"brick" amplifier to get round this. The other restriction is the audio
output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on
climbing trips and use in hotel rooms when travelling. Sure there is no
autopatch capability, but look at the size and price! The scanning
capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz
from a 12,000 ft mountain in Yosemite National Park - about 150 miles -
all on the 3 inch long antenna! Also used it in the UK a couple of weeks
ago - the C-508A built-in 1750 tone capability is needed to access British
repeaters.

Let me know if you need more info.

From: rick.edwards@mogur.com (Rick Edwards)
Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much.
However, I do have a couple of questions that I can't seem to find the
answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the
autodialer memory number (#1 in my case). The transmitter turns on when
the PTT is pressed, of course, but then turns off when the PF button is
pressed and then back on for the DTMF string. However, there is no (or
very little) pause between the transmitter turn on and the sending out
of DTMF. I use two repeater autopatches and neither of them likes this
and it _usually_ results in a misdial. Question: Is there anyway to
add a pause or a brief wait between the transmitter turning back on and
the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220
repeater and my 2m HT, I have to wait for the 220 repeater to drop
before I can transmit. This becomes a real drag when on a roundtable
on the 220 repeater and it has a long hang time. Is there anyway
around this? Is there a way to make the 742A act like a single
frequency repeater on the 2m side (ie. sample the receive every few
hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter module installed, you had to turn the rig on, then off and then on again because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the microprocessor for some reason. Changing out the VCO in the '42A did no good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

consider it a good buy, and agree with the others that the original
poster should wait for the next sale. I'm hoping to get my boy one for
himself for Christmas, so I'm waiting for a sale near then, myself.

Subject: Sub-audible tone generator

I have a Kenwood tr-7950 that does not have the optional tu-79 tone unit
installed. Kenwood says that option is no longer available. does any
one know of a way to build one? The local repeaters are all using 100Hz
tones, so thats the only one I will need.
Any info about how to make one or how to modify another unit to work in
the 7950 would be appreciated.

Thanks,

Butch KF5DE

I have had my TM-742A with a six-meter module for almost two
years. The unit is used daily as a mobile rig. Absolutely
zero problems so far.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

Just recieved my no code licence in the mail and iam itching to buy a radio. Most books recommend a 2m ht as a first radio. any reccomendations out there. Ive been looking at the yaesu ft11 is this a good radio to start out with? you can buy them for less than 300.00. It is small, and has a backlit display. In major metro areas Iam in the San F. bay area do you need 5watt versions of HT's.?

1404. HF tranciever vs reciever's for audio quality

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-02 00:00:00 UTC
From: billh33047@aol.com

Source record: 213039

Iam new to Ham radio having just passed my no-code licence, and have already begun learning the code. What got me interested in Ham was listening to the Major shorwave broadcasts BBC etc. At one time I fashioned buying a top of the line communications reciever DrakeR8, Kenwood 5000 or Japan radio all of which are known for there good audio quality as well as there dx ability. Now that Iam making my way into ham radio Ive noticied that for example some of the kenwood transcievers are priced not to much higher than the top of the line coommmunications recievers. Ill always want to continue listening to the major SW broadcasters. I like the what i think is the more balanced news perspective of the bbc. Currently I have a grundig sat 700 reciever. Are the audio quality most importantly listenability good on the mid priced trancievers in comparison to the high end recievers? Will I miss Synch detection commonly used on communications recievers? Are some trancievers esp known for there audio quality-dynamic range? Thanks, iam betting there is some hams who also listen to the majors and have been thru this dillema. Bill Hansen

From: wright@onramp.net (jeff wright)
Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of
those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

Our local Radio Shack stores stock only HF SWR meters,

HOWEVER

They were able to order an inline SWR/POWER meter for 2m/70cm. This is
not in our stores but is still available.

Details:
Part number = 10508018
Price = $46.19 which is cost+postage+tax
Time for home delivery = 7 to 10 working days.

From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

From: swdecato@nps.navy.mil
Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper

battery connection. I'm just wondering if I could get the thing to work on
2 meters.

From: travisp@ix.netcom.com (Gerald Phillips)
Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later

this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed

the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

Hi Tom, I too have tried several computer logging programs. I assume you are interested in the casual day-to-day logging, not contest logging. For casual daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I believe
version 2.24 was a "testware" program that allowed free testing for a period of time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before, date, time, band, etc. Shows QSO's with that country before. Automatically tally's DXCC and WAS by band, by mode. Has default settings for power-up (I enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option allows me to store long/lat data of my qth and shows the lp and sp and distance to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says "less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I still am using the HYPERLOG software. No, I have no affiliation with Hyperlog in any way. A friend in JA introduced me to the software after trying something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

> not result in any further increase in RF output.

This is because the radio has a feedback circuit which measures the power
output (actually it often measures the RF voltage output), and adjusts the

RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>I'd be interested in finding out whether other HTs have

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only
from California...

The last U-Haul I rented had binding posts on the dash with 12VDC
available. I suppose we could tell each other that they did it for the
Ham community, but my real guess is that they got tired of people
butchering the wiring to hook up CB's. I know from several years of
experience in repairing over-the-road trucks that some people will cut
into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the limited output power - even with an external antenna on a car I have difficulty getting reliable QSOs thru repeaters. I am looking at buying a "brick" amplifier to get round this. The other restriction is the audio output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on climbing trips and use in hotel rooms when travelling. Sure there is no autopatch capability, but look at the size and price! The scanning capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220
repeater and my 2m HT, I have to wait for the 220 repeater to drop
before I can transmit. This becomes a real drag when on a roundtable
on the 220 repeater and it has a long hang time. Is there anyway
around this? Is there a way to make the 742A act like a single
frequency repeater on the 2m side (ie. sample the receive every few
hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

Alan, WA6AQC

Subject: Out of band RX on FT-51R

A few days ago I posted a way to extend the RX on the FT-51R. I didn't
try it until yesterday and I couldn't seem to get it to work. I know
there are a few people out there that got it to work, do you think you can
help me? I changed the line to 1 after I loaded in a template, then
downloaded the same file to the radio, but it still doesn't seem to want
to accept out of band RX freqs.

Any help will be appreciated.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

From: Bill <Bill@survival.demon.co.uk>
Subject: Regulations Shortwave Transmitter/Receiver must fullfill (help)

A UK based charity has developed a pedal powered generator to operate a short-wave transmitter/receiver working at (4.005 MHz). The use is to supply village to village communication in Tanzania Africa. A small pilot project has successfully run for the last 12
years with commercial bought in equipment. The aim is to manufacture pedal generators and short-wave transmitter/receivers locally in Tanzania both to save foreign currency and provide
local employment.

A transmitter/receiver has been designed and 95 per cent completed.

Does anyone know what international regulations such a short-wave transmitter/receivers would have to comply with? The project is based in the UK.

Thank you for any help anyone can give.

Bill

Butch, It shouldn't be that hard to put in an aftermarket tone board. The factory board will only let you set it up for three different frequencies, if I remember correctly. If you only need one frequency, I would look at one of the miniature tone boards that Communications Specialists sell. They are available from a lot of the mail order places. They are very simple to hook up. The original factory tone board plugged into a small plug on the 7950. My guess it was a B+, GND and tone into the radio line. Even if it is not, you can call Communications Spealists and they will tell you where to connect their boards on most radios. I hope this helps....73's Floyd WD5ENJ

Subject: Radio Shack 2m HT - Is it a good by for the price?

hdc@netmetro.com (hdc@netmetro.com) wrote:
> I would appreciate your comments on the Radio Shack 2m Handheld
> transceiver.
> I'm a rank beginner with my new tech licence, looking for my
> first rig.

Not to send you off the track of a HTX-202, but I've just heard about
the 4th radio in my county going on the blink. Intermittent transmit.

All the same problem. The latest one is 3 months old. Whenever used on 12 V. it is on a mobile 5/8 antenna.

True, I don't know how many operators in my county have the HTX-202, exactly. There are approximately 1300 or so amateurs that live in my county. I'm sure they don't all own the HTX-202. ;-)

The ones that do work sound good. The owners like them. Just about every owner that I have talked to has the extended warranty. (And it is apparently pretty good tha they do have it...)

> Is it a good buy for $260? I notice that they bundle in a few
> options in the
> price, that others don't. Is there a better choice in that
> price range?

Considering the problems that I've heard with this HT, >if it were me<, I wouldn't purchase it without the extended warranty. Figure another $40 or whatever it costs onto the price of your HT. Now you're looking at around $300. Is it worth that much? In my opinion, no.

Now if you get it for the sale price of around $190 + $40 warranty, you're looking at $230ish. Yeah, maybe it is worth that to someone. Did I say "Don't buy this radio without the warranty?" Well, if I didn't say it, be sure you don't buy it without the warranty.

Actually, I think Radio Shack ought to adjust the price of their radio so it includes the price of the 5 year warranty. Of course, others may not think that way... I'm just going by the track record I've seen from locals on this radio...

I must add that Radio Shack has been very good to the locals in the customer service department. They stand behind their product. That is an important consideration when considering a purchase of most anything.

It is reported that the HTX-202 is very good in a high RF environment. It tends to not suffer from intermod interference. This might be something to consider, too.

All in all, I'm pretty neutral on the HTX-202. I probably wouldn't buy one for myself, but I'm not in the market for a 2M HT, either.

Contratulations on your new license and enjoy--

73,
Ken

Why? Just more government regulation in our life. There
may be no law that says they cannot sell Amateur equipment
to anyone, but there is no law that says you HAVE to sell
anyone Amateur equipment. Likewise there is no law that
prevents the seller from having a policy of NOT selling
to anyone without the proper license.

Subject: HF tranciever vs reciever's for audio quality

Iam new to Ham radio having just passed my no-code licence, and have
already begun learning the code. What got me interested in Ham was
listening to the Major shorwave broadcasts BBC etc. At one time I
fashioned buying a top of the line communications reciever DrakeR8,
Kenwood 5000 or Japan radio all of which are known for there good audio
quality as well as there dx ability. Now that Iam making my way into ham
radio Ive noticied that for example some of the kenwood transcievers are
priced not to much higher than the top of the line coommmunications
recievers. Ill always want to continue listening to the major SW
broadcasters. I like the what i think is the more balanced news
perspective of the bbc. Currently I have a grundig sat 700 reciever. Are
the audio quality most importantly listenability good on the mid priced
trancievers in comparison to the high end recievers? Will I miss Synch
detection commonly used on communications recievers? Are some trancievers
esp known for there audio quality-dynamic range? Thanks, iam betting there
is some hams who also listen to the majors and have been thru this
dillema. Bill Hansen

From: wright@onramp.net (jeff wright)
Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of

those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

Subject: Radio Shack 2 meter SWR meter

Our local Radio Shack stores stock only HF SWR meters,

HOWEVER

They were able to order an inline SWR/POWER meter for 2m/70cm. This is
not in our stores but is still available.

Details:
Part number = 10508018
Price = $46.19 which is cost+postage+tax
Time for home delivery = 7 to 10 working days.

From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

From: swdecato@nps.navy.mil
Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper
battery connection. I'm just wondering if I could get the thing to work on
2 meters.

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

I have a 733 and I'm very happy with it. I have a dual band handheld
and I use the cross band repeater function in the 733 often. I have
it mounted in a manner similar to yours and that's why I purchased
it.

I wouldn't register Hyperlog anytime soon. Apparently Hyperlog Pro
will be out soon and I don't know that registered users of Hyperlog
will get any break on the new version.

>Tom

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically
tally's DXCC and WAS by band, by mode. Has default settings for power-up (I
enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option
allows me to store long/lat data of my qth and shows the lp and sp and distance
to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says "less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I still am using the HYPERLOG software. No, I have no affiliation with Hyperlog in any way. A friend in JA introduced me to the software after trying something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

> not result in any further increase in RF output.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>

My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be

reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the
limited output power - even with an external antenna on a car I have
difficulty getting reliable QSOs thru repeaters. I am looking at buying a
"brick" amplifier to get round this. The other restriction is the audio
output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on
climbing trips and use in hotel rooms when travelling. Sure there is no

autopatch capability, but look at the size and price! The scanning capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220 repeater and my 2m HT, I have to wait for the 220 repeater to drop before I can transmit. This becomes a real drag when on a roundtable on the 220 repeater and it has a long hang time. Is there anyway around this? Is there a way to make the 742A act like a single frequency repeater on the 2m side (ie. sample the receive every few hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

Subject: Regulations Shortwave Transmitter/Receiver must fullfill (help)

A UK based charity has developed a pedal powered generator to operate a short-wave
transmitter/receiver working at (4.005 MHz). The use is to supply village to village
communication in Tanzania Africa. A small pilot project has successfully run for the last
12
years with commercial bought in equipment. The aim is to manufacture pedal generators and
short-wave transmitter/receivers locally in Tanzania both to save foreign currency and
provide
local employment.

A transmitter/receiver has been designed and 95 per cent completed.

Does anyone know what international regulations such a short-wave transmitter/receivers
would have to comply with? The project is based in the UK.

Thank you for any help anyone can give.

Bill

Butch, It shouldn't be that hard to put in an aftermarket tone board.
The factory board will only let you set it up for three different
frequencies, if I remember correctly. If you only need one frequency,
I would look at one of the miniature tone boards that Communications
Specialists sell. They are available from a lot of the mail order
places. They are very simple to hook up. The original factory tone
board plugged into a small plug on the 7950. My guess it was a B+,
GND and tone into the radio line. Even if it is not, you can call
Communications Spealists and they will tell you where to connect their
boards on most radios. I hope this helps....73's Floyd WD5ENJ

Subject: Yaesu FT-530 replacement antenna

I also have a FT-530 and replaced the stock antenna with a Diamond RH77CA
rubber duck. It is about 14.5" inches long from the base.
It is far superior than the stock antenna. I paid $35 for it at the local
Ham Radio Outlet store. I've seen these at hamfests for around $20.

Subject: Radio Shack 2m HT - Is it a good by for the price?

hdc@netmetro.com (hdc@netmetro.com) wrote:
> I would appreciate your comments on the Radio Shack 2m Handheld
> transceiver.
> I'm a rank beginner with my new tech licence, looking for my
> first rig.

Not to send you off the track of a HTX-202, but I've just heard about
the 4th radio in my county going on the blink. Intermittent transmit.
All the same problem. The latest one is 3 months old. Whenever used
on 12 V. it is on a mobile 5/8 antenna.

True, I don't know how many operators in my county have the HTX-202,
exactly. There are approximately 1300 or so amateurs that live in my
county. I'm sure they don't all own the HTX-202. ;-)

The ones that do work sound good. The owners like them. Just about
every owner that I have talked to has the extended warranty. (And it
is apparently pretty good tha they do have it...)

> Is it a good buy for $260? I notice that they bundle in a few
> options in the
> price, that others don't. Is there a better choice in that
> price range?

Considering the problems that I've heard with this HT, >if it were me<,
I wouldn't purchase it without the extended warranty. Figure another
$40 or whatever it costs onto the price of your HT. Now you're looking
at around $300. Is it worth that much? In my opinion, no.

Now if you get it for the sale price of around $190 + $40 warranty, you're
looking at $230ish. Yeah, maybe it is worth that to someone. Did I
say "Don't buy this radio without the warranty?" Well, if I didn't say it,
be sure you don't buy it without the warranty.

Actually, I think Radio Shack ought to adjust the price of their radio
so it includes the price of the 5 year warranty. Of course, others may
not think that way... I'm just going by the track record I've seen from
locals on this radio...

I must add that Radio Shack has been very good to the locals in the
customer service department. They stand behind their product. That is
an important consideration when considering a purchase of most anything.

It is reported that the HTX-202 is very good in a high RF environment. It
tends to not suffer from intermod interference. This might be something
to consider, too.

All in all, I'm pretty neutral on the HTX-202. I probably wouldn't buy
one for myself, but I'm not in the market for a 2M HT, either.

Contratulations on your new license and enjoy--

73,
Ken

From: wright@onramp.net (jeff wright)
Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of
those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

Date: 29 Aug 1995 20:58:04 GMT
From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

From: swdecato@nps.navy.mil
Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper
battery connection. I'm just wondering if I could get the thing to work on
2 meters.

From: travisp@ix.netcom.com (Gerald Phillips)
Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically
tally's DXCC and WAS by band, by mode. Has default settings for power-up (I
enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option
allows me to store long/lat data of my qth and shows the lp and sp and distance
to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says
"less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I
still am using the HYPERLOG software. No, I have no affiliation with Hyperlog
in any way. A friend in JA introduced me to the software after trying
something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess

High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>I'd be interested in finding out whether other HTs have

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need

some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the
limited output power - even with an external antenna on a car I have
difficulty getting reliable QSOs thru repeaters. I am looking at buying a
"brick" amplifier to get round this. The other restriction is the audio
output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on
climbing trips and use in hotel rooms when travelling. Sure there is no
autopatch capability, but look at the size and price! The scanning
capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz
from a 12,000 ft mountain in Yosemite National Park - about 150 miles -
all on the 3 inch long antenna! Also used it in the UK a couple of weeks
ago - the C-508A built-in 1750 tone capability is needed to access British
repeaters.

Let me know if you need more info.

From: rick.edwards@mogur.com (Rick Edwards)
Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much.
However, I do have a couple of questions that I can't seem to find the
answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the
autodialer memory number (#1 in my case). The transmitter turns on when
the PTT is pressed, of course, but then turns off when the PF button is
pressed and then back on for the DTMF string. However, there is no (or
very little) pause between the transmitter turn on and the sending out
of DTMF. I use two repeater autopatches and neither of them likes this
and it _usually_ results in a misdial. Question: Is there anyway to
add a pause or a brief wait between the transmitter turning back on and
the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220
repeater and my 2m HT, I have to wait for the 220 repeater to drop
before I can transmit. This becomes a real drag when on a roundtable
on the 220 repeater and it has a long hang time. Is there anyway
around this? Is there a way to make the 742A act like a single
frequency repeater on the 2m side (ie. sample the receive every few
hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

Any input on the Kenwood TM-742A would be apreciated (sp).

In particular I am looking for anyone who has had problems with this Rig
but all comments are welcome.

Wouldn't it be great if it were an all-mode?

TNX, 73s

Subject: Out of band RX on FT-51R

A few days ago I posted a way to extend the RX on the FT-51R. I didn't try it until yesterday and I couldn't seem to get it to work. I know there are a few people out there that got it to work, do you think you can help me? I changed the line to 1 after I loaded in a template, then downloaded the same file to the radio, but it still doesn't seem to want to accept out of band RX freqs.

Any help will be appreciated.

: not be that important if you live in an uncrowded area, but in the

Jim, you reminded me of the one beef I have. The memories are OK for my area and so not a problem, but I do wish the keyboard was lighted!!!! The display lights up OK and is readable, but given when I use it in emergency drills and such, a lighted keypad is a must in my next HT. The original poster should consider this as well. Otherwise, I still consider it a good buy, and agree with the others that the original poster should wait for the next sale. I'm hoping to get my boy one for himself for Christmas, so I'm waiting for a sale near then, myself.

Subject: Sub-audible tone generator

I have a Kenwood tr-7950 that does not have the optional tu-79 tone unit installed. Kenwood says that option is no longer available. does any one know of a way to build one? The local repeaters are all using 100Hz tones, so thats the only one I will need.
Any info about how to make one or how to modify another unit to work in the 7950 would be appreciated.

Thanks,

I have had my TM-742A with a six-meter module for almost two
years. The unit is used daily as a mobile rig. Absolutely
zero problems so far.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I

had no faith that the working ones would continue to do so.

From: Bill <Bill@survival.demon.co.uk>
Subject: Regulations Shortwave Transmitter/Receiver must fullfill (help)

A UK based charity has developed a pedal powered generator to operate a short-wave transmitter/receiver working at (4.005 MHz). The use is to supply village to village communication in Tanzania Africa. A small pilot project has successfully run for the last 12
years with commercial bought in equipment. The aim is to manufacture pedal generators and short-wave transmitter/receivers locally in Tanzania both to save foreign currency and provide
local employment.

A transmitter/receiver has been designed and 95 per cent completed.

Does anyone know what international regulations such a short-wave transmitter/receivers would have to comply with? The project is based in the UK.

Thank you for any help anyone can give.

Bill

Butch, It shouldn't be that hard to put in an aftermarket tone board.
The factory board will only let you set it up for three different
frequencies, if I remember correctly. If you only need one frequency,
I would look at one of the miniature tone boards that Communications
Specialists sell. They are available from a lot of the mail order
places. They are very simple to hook up. The original factory tone
board plugged into a small plug on the 7950. My guess it was a B+,
GND and tone into the radio line. Even if it is not, you can call
Communications Spealists and they will tell you where to connect their
boards on most radios. I hope this helps....73's Floyd WD5ENJ

I also have a FT-530 and replaced the stock antenna with a Diamond RH77CA
rubber duck. It is about 14.5" inches long from the base.
It is far superior than the stock antenna. I paid $35 for it at the local
Ham Radio Outlet store. I've seen these at hamfests for around $20.

From: wright@onramp.net (jeff wright)
Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of
those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

From: swdecato@nps.navy.mil
Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper

battery connection. I'm just wondering if I could get the thing to work on
2 meters.

I had my one and only Periphex battery that I bought for a Yaesu HT. Battery did not last more than 8 months. Nedless to say, it was the last Periphex battery that I bought.

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later

this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed

the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

Hi Tom, I too have tried several computer logging programs. I assume you are interested in the casual day-to-day logging, not contest logging. For casual daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I believe
version 2.24 was a "testware" program that allowed free testing for a period of time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before, date, time, band, etc. Shows QSO's with that country before. Automatically tally's DXCC and WAS by band, by mode. Has default settings for power-up (I enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option allows me to store long/lat data of my qth and shows the lp and sp and distance to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says "less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I still am using the HYPERLOG software. No, I have no affiliation with Hyperlog in any way. A friend in JA introduced me to the software after trying something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

> not result in any further increase in RF output.

This is because the radio has a feedback circuit which measures the power
output (actually it often measures the RF voltage output), and adjusts the

RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>I'd be interested in finding out whether other HTs have

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only
from California...

The last U-Haul I rented had binding posts on the dash with 12VDC
available. I suppose we could tell each other that they did it for the
Ham community, but my real guess is that they got tired of people
butchering the wiring to hook up CB's. I know from several years of
experience in repairing over-the-road trucks that some people will cut
into any wire with power on it to hook up accessories.

Drive safe.

Subject: Need Ten Tec SCOUT555 info

Does anybody have or know about SCOUT-555 inexpensive mono
band transceiver from Ten Tec? Please let me ask you a couple
of questions.

1.What sort of circuit is in a band module? The band module
is the one you have to pull out and push another one into the
transceiver to change the band.

2.Would it be possible to build the band module by yourself?

Thanks in advance,
Atsushi Otsuka, 7K2COJ/KE6FFS

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the limited output power - even with an external antenna on a car I have difficulty getting reliable QSOs thru repeaters. I am looking at buying a "brick" amplifier to get round this. The other restriction is the audio output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on climbing trips and use in hotel rooms when travelling. Sure there is no autopatch capability, but look at the size and price! The scanning capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220
repeater and my 2m HT, I have to wait for the 220 repeater to drop
before I can transmit. This becomes a real drag when on a roundtable
on the 220 repeater and it has a long hang time. Is there anyway
around this? Is there a way to make the 742A act like a single
frequency repeater on the 2m side (ie. sample the receive every few
hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

From: Bill <Bill@survival.demon.co.uk>
Subject: Regulations Shortwave Transmitter/Receiver must fullfill (help)

A UK based charity has developed a pedal powered generator to operate a short-wave transmitter/receiver working at (4.005 MHz). The use is to supply village to village communication in Tanzania Africa. A small pilot project has successfully run for the last 12
years with commercial bought in equipment. The aim is to manufacture pedal generators and short-wave transmitter/receivers locally in Tanzania both to save foreign currency and provide
local employment.

A transmitter/receiver has been designed and 95 per cent completed.

Does anyone know what international regulations such a short-wave transmitter/receivers would have to comply with? The project is based in the UK.

Thank you for any help anyone can give.

Bill

Butch, It shouldn't be that hard to put in an aftermarket tone board. The factory board will only let you set it up for three different frequencies, if I remember correctly. If you only need one frequency, I would look at one of the miniature tone boards that Communications Specialists sell. They are available from a lot of the mail order places. They are very simple to hook up. The original factory tone board plugged into a small plug on the 7950. My guess it was a B+, GND and tone into the radio line. Even if it is not, you can call Communications Spealists and they will tell you where to connect their boards on most radios. I hope this helps....73's Floyd WD5ENJ

From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper
battery connection. I'm just wondering if I could get the thing to work on
2 meters.

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically
tally's DXCC and WAS by band, by mode. Has default settings for power-up (I
enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option

allows me to store long/lat data of my qth and shows the lp and sp and distance to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says "less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I still am using the HYPERLOG software. No, I have no affiliation with Hyperlog in any way. A friend in JA introduced me to the software after trying something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>I'd be interested in finding out whether other HTs have

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of

experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the limited output power - even with an external antenna on a car I have difficulty getting reliable QSOs thru repeaters. I am looking at buying a "brick" amplifier to get round this. The other restriction is the audio

output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on climbing trips and use in hotel rooms when travelling. Sure there is no autopatch capability, but look at the size and price! The scanning capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

From: rick.edwards@mogur.com (Rick Edwards)
Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220 repeater and my 2m HT, I have to wait for the 220 repeater to drop before I can transmit. This becomes a real drag when on a roundtable on the 220 repeater and it has a long hang time. Is there anyway around this? Is there a way to make the 742A act like a single frequency repeater on the 2m side (ie. sample the receive every few hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

From: tigger@jcomm.uoregon.edu (Max Sabo)
Subject: Out of band RX on FT-51R

A few days ago I posted a way to extend the RX on the FT-51R. I didn't try it until yesterday and I couldn't seem to get it to work. I know there are a few people out there that got it to work, do you think you can help me? I changed the line to 1 after I loaded in a template, then downloaded the same file to the radio, but it still doesn't seem to want to accept out of band RX freqs.

Any help will be appreciated.

: not be that important if you live in an uncrowded area, but in the

Jim, you reminded me of the one beef I have. The memories are OK for my area and so not a problem, but I do wish the keyboard was lighted!!!! The display lights up OK and is readable, but given when I use it in emergency drills and such, a lighted keypad is a must in my next HT. The original poster should consider this as well. Otherwise, I still consider it a good buy, and agree with the others that the original poster should wait for the next sale. I'm hoping to get my boy one for himself for Christmas, so I'm waiting for a sale near then, myself.

Subject: Sub-audible tone generator

I have a Kenwood tr-7950 that does not have the optional tu-79 tone unit
installed. Kenwood says that option is no longer available. does any
one know of a way to build one? The local repeaters are all using 100Hz
tones, so thats the only one I will need.
Any info about how to make one or how to modify another unit to work in
the 7950 would be appreciated.

Thanks,

Butch KF5DE

I have had my TM-742A with a six-meter module for almost two
years. The unit is used daily as a mobile rig. Absolutely
zero problems so far.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

1417. TM-742A Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-03 00:00:00 UTC
From: hduff@humnet.humberc.on.ca
Message-ID: <797152498701@humnet.humberc.on.ca>
Source record: 212902

I have 2 of the predecessor to the 742...the TM-741A and love 'em !

If you like rigs with lots of bells and whistles then this is
the one for you. Cross band repeat, lots of TX power, receive
all 3 bands simultaneously, run any 3 bands from 28, 50, 144,
220, 440, 1200 Mhz.

I have never had a problem with either of mine.
The RF modules are bullet proof ! I have actually run one of the
modules as a standalone transceiver without the main chassis.
I know these rigs fairly well from the inside-out.

2 thumbs up !

Mike: In your area it will be a major bona fide miracle if you can find
a frequency to operate on. 25 years ago I put a college station on the
air in a location just into PA along route 80. At that time, we could
do it with 10 watts, which is the coverage you propose. Since then, the
FCC has upped the stakes, and you get NO, NONE, NADA, ZIP, ZERO protection
from interference if you are less than 100 watts. The norm appears to
be about 1 KW today. I'm talking non-commercial FM here. What you miight
try is something that schools out west did back then, and that is CableRadio.
See if you can get the local cable system to put a modulator on an unused
FM frequency in your area. Of course, only those who have cable service can
get your signal. It does solve a lot of problems, though. You might post
to rec.radio.broadcast or rec.radio.noncommercial for more help.

Message-ID: <42b5vh$54h@ralph.vnet.net>
Source record: 212957

I have an MC-85 Kenwood Mike that appears to be causing a feedback problem. I have placed a ferrite filter over the cord near the radio and that seems to have eliminated quite a bit of the problem, but after transmitting a while, it affects the relay in the radio & the relay doesn't release immediately after releasing the PTT. Any ideas or mods available to eliminate this problem? My old MC-50 dynamic mike causes no problems. The radio is a Kenwood TS850S/AT. Thanks for any help. Terry KD4GBO

>an unlicensed person. That person sued and won.
>

I used to be a 50% owner of a Ham Radio store in Tennessee.
We had a clearly posted store policy that was in plain sight.

it was simple...

..We do not sell Amateur Radio equipment capable of transmitting
to anyone who does not hold a valid Amateur Radio License.

Now we did not go so far as to say you cannot but a 2M FM rig
because you only have a Novice ticket..No..If you held a license you
could buy anything in the store...no license...receiving gear only.
We were sued by two people who wanted to buy 440 HT's....They
lost.
I don't know which court that person won in, but I assure
you have no legal rights (except for equal housing laws) that can force
anyone to sell anything to you if they do not want to....

1424. Info needed on AN/VRC-18 Radio Set

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-03 00:00:00 UTC
From: ke6tgn@ix.netcom.com
Message-ID: <42bcn1$f28@ixnews6.ix.netcom.com>
Source record: 212961
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap,rec.radio.misc

Fair Radio sells the VRC-18 set. It consists of an RT-68/GRC transceiver, R-110 Reciever, PP-112 & 282 24VDC power supplies, mic, two headsets, speaker, mast base, antenna, cables, manuals, etc.Is it a good system? They stste it has been Government Reconditioned.

According to the item description in the catalog it is continuosly tuneable or in 100khz steps frpm 38 - 54.9mhz. Is the transceiver section (RT-68/GRC) continuosly tunable? I'm looking fo a good, cheap and rugged rig to get on 6m with. They sell the set for $250.00 plus shipping.

They also sell just the RT-68/GRC (used--not reconditioned) transceiver for $75.00 (may be better deal in the long run considering shipping weight is only 42lbs. on the RT and 185lbs. for the set??? [I live in CA]).

Any opinions/problems/suggestions?

Thanks!!

John

Hi Ken, I have a photo copy of the manuel you need. I will be happy to provide you with a photo copy. I am not sure of the 4th generation quality however. E-mail me with your address and I will let you know what the coping will cost as well as the postage. By the way I am using this with my 6m AM Comm IV am it seems to be OK... If you know of a proper manuel for this rig pse let me know.

> My interest in 6m is growing.....thought I'd throw out a few questions
>going through my mind.

yeah, it's addicting... be careful!-)

> Is a multi mode 6M rig worth the expense(when I don't have an HF rig
>that will take a 6M model) or do most just work FM?

I've started on FM, and had a very good time with it. A 6m FM-only will be
less expensive than an all-mode.

>Do most just work simplex, or work repeaters?

Well, I started with my Motorola Mitrek that I converted to 6m operation
mostly by retuning it (I still have to change the capacitors in the
pre-scaler, so it's still a little deaf). If you get the manual, there
are many "VHF Low Band" commercial radios available used for good prices
that are easy to convert (relatively ;-).

The Mitrek only does one channel (52.525 MHz FM) simplex, and that's
been fine. Worked as far as Montana from So Cal this past summer!

6m can be useful on repeaters, since (around here at least) intermod
is less of a problem.

>Do operaters on 6M have problems causing interference on the TV
>frequencies?(I've heard that used to be a problem)

Still is. Cable TV helps, but I still clobber my wife's TV downstairs, though
the TV next to the rig is fine (we'll be swapping them...;-).

You can avoid it completely by operating mobile. I have worked Oregon while
mobile, so don't let anyone tell you mobile won't do DX! (Also, that Montana
station was mobile...;-)

>Why do many 6M Rigs only operate on 10 watts?

Mostly TVI, I bet. There are lots of (older) rigs that do 100W. Also,
many of the new HF+6m allmodes do 100W on 6m (I think the Icom 736 does,
and I know the JST-245 does).

>I probably can't afford to get into 6M right away, but research dosen't
>cost too much!

Do two things:

Get: "Six Meters, The Magic Band" from Worldradio Books in Sacramento California. Just do it. It's worth far more than you will pay for it (which is something like US$12 !!!-).

Start looking for used 6m equipment. Most will be in fine shape. I found a Drake TR-6 (100W CW/AM/SSB) for "cheap" at a local swap recently. I can happen to you if you are prepared...

FREE - NEW Macintosh HAM TEST SIMULATORS

Studying for a ham test and have access to an Mac?

Upgrade Fast! Simulate the test and get S T I M U L A T E D!

Scores of 90% or > even get applause!

The new Macintosh Ham Test Simulators are HERE (and there if you can FTP)!

o Novice Ham Test 5.0 SA.sea
o Technician Ham Test 5.0 SA.sea
o General Ham Test 5.0 SA.sea
o Advanced Ham Test 5.1 SA.sea
o Extra Ham Test 5.0 SA.sea

The latest version "5" feature:

HyperCard 2.3 as a stand-alone application (SA) eliminating
your need to have HyperCard. All you need is a Mac with 4
Meg of memory and version System 7 or greater.

Each version "5" Ham Test Simulator has the latest questions
as prepared by the Question Pool Committee.

Each version "5" Ham Test Simulator is FREE OF CHARGE and work the
same way as the originals did (written by Diana, KC1SP).

You may obtain a version "5" Ham Test Simulator by mailing me a *FORMATTED
disk (1 per test) and include a Self Addressed and Stamped disk mailer for
the return.

Each version "5" Ham Test Simulator is also bundled with a shareware CW
program called MacMorse 1.4 written by Doug, WB0EON.

Also included in the version "5" collection are text files that relate an
interesting variety of ideas about the best way to study CW and prepare
for tests.

Or warm your phone line and get JUST the tests:

America On Line - Macintosh Ham Radio Section

or:

1437. NEED INFO on Alinco DR600

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-03 00:00:00 UTC
From: rwham@aol.com
Message-ID: <42cbd4$kgf@newsbf02.news.aol.com>
Source record: 212974

Does anyone know how to increase the time delay between keydown and first tone (its not long enough) when operating the Alinco DR-600 on (DTMF) DSQ? How about decreasing the DTMF sequence tone transmission rate (its too fast)? Thanks for any info.....Robert

>KE6TGN
Here's a couple of questions I'd as Fair Radio:

1. Does it do FM?
2. If so, does it do split? If not, it's no good for repeaters.
3. What deviation? If it's too high on transmit, you can turn the mike gain down, but if it's too high on receive (i.f. bandwidth) you're stuck.
3. If it does SSB (not likely), how stable is the vfo?
4. If it doesn't do either of the above, that only leaves you with AM, which will work, but you're really asking for TVI problems on six with AM if you're in a channel 2 area.

The net result is that if it's an FM-only rig (most likely), you'd be better off for the price with an Azden or similar rig designed for ham radio. They're a little more than $250, but in the long run, I think you'd be happier. And they only weigh a pound or two, not 185!!

Good luck.

Source record: 212978
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I al building SUPER SMALL RADIOCONTROL ELECTRIC AIRPLANES (bellow 4 oz, with 3 proportional chanels). My latest airplane weight 3 oz 1/2, use 4 cells Ni-CD 110 mA, a FM 4 chanel proportional Receiver (6 grammes), 2 servos of 6 grammes (hand built in the USA), and a 3 grammes Electronic throttle (German)... all this is MUCH smaller then the CANNON RC System.

I am trying to built now a 2 oz Electric airplane, and for this I need even smaller RC systems, runing under less than 5 volts.

Do you know somebody manufacturing :

- SUPER SUPER small RC Systems (Using servos or actuators, but in all cases PROPORTIONAL)
- SUPER SMALL Electric DC motors with resonable efficiency under 1 or 2 Cells (1 to 2 volts !!). Some Micro COBALT ??

1442. Kenwood TK series Land Mobile Radios

From: jschwart@ix.netcom.com
Message-ID: <42cja0$3ne@ixnews5.ix.netcom.com>
Source record: 212979

I'm looking for some information on Kenwood TK-701 S-1 and TK-801 S-1 16 channel commercial radios. Specifically, I have the following questions:

1. What is the range of frequencies that either model's synthesizers will allow programming and will lock?

2. Phase modulation or frequency modulation?

3. Power output?

4. These are prom programmable. Is the programming software available? (I'll have the prom burner)

5. Suitable for high speed data (9600 baud packet)?

6. Suitable for point to point linking?

7. Anyone got a manual for either/both available for review or purchase?

Thanks in advance for the help. E-mail responses to jschwart@ix.netcom.com.

For Sale: Motorola Micor mobile radios

Brief description:

These are 110 watt Motorola Micor mobile radio systems, 12 channels, made to be mounted in the trunk with a remote control head, speaker and mic in the front of the
vehicle.

They are available bare radio alone, or with the control cable, head, mic, speaker, scanner head, and CTCSS select head.

They are in the 150.8 162.0 Mhz. band segment. They can be converted to Amateur 2 meter radio use by changing crystals and a little tuning.

Asking $50 each, including accessories, you pay shipping. Discounts for large volumes are possible.

For further info please e-mail lelandh105@aol.com

1446. TS 440 advice on L3 (IF board)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-03 00:00:00 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <11092.810161310@safety.ics.uci.edu>
Source record: 212983

I reinstalled my IRCI 2.1 kHz filter in the 455 kHz line and found that my S meter read much lower than before. (It tracked my 940 pretty well before, was now way down from that.) Can't figure out why the change, only removed the IF board and soldered in the 455 kHz filter, but there it was.

Anyway, I went to my Kenwood service manual to realign the S meter as best as I could, no instruments here. I reset zero, and reset the S9 adjustment to track the 940 meter, but they also have you set L3 (coupling the IF line between 8.8 MHz IF and 455 kHz IF) for "S1" . I found that the slug in my L3 was almost falling out of the can for some reason, though it seems tight as far as screwing it in and out. Can't figure that one out, but, I screwed the slug back in to see how it affected things, and it seems to affect the gain in the IF line. I screwed it way down in and got a lot more gain, of course the S meter read higher now. I reset the other adjustments VR1 and VR2 for similar readings to my 940. No big deal on accuracy here, I know I can't expect much.

However, my big question is: anyone have a 440 and can you tell me where the slug seems to be in your L3 on the IF board? (Just above the SSB optional filter slot). Also, any technicians know how important this adjustment is? Am I cranking up the gain too much by tightening this transformer without the proper instruments? (Should get "S1" for an RF signal on 20 meters in USB of 8db/u.)

Any help?

Good policy, I like it. This doesn't come without a "but" however. I
don't disagree with the stores policy, I just wonder what would happen if
Mrs. X (unlicensed) comes in to buy a goodie for Mr. X. (wa4***). Lost
sale? As far as the courts go, I would be willing to bet the house that
if a "Native American, Afro-hispanic - transgendered lesbian " strolled in
the store and was refused a sale, he, she or it and the planeload of
lawyers would end up owning the store, your house, your car, and other
things you don't even poses yet. Scary thought.

From: jjmartin@world.std.com
Message-ID: <DECADw.E8F@world.std.com>
Source record: 212990

jdb99@ix.netcom.com (jdb) sed:

:> I used to be a 50% owner of a Ham Radio store in Tennessee.
:>We had a clearly posted store policy that was in plain sight.
^^^^^^^^^^^^
:>it was simple...

:>..We do not sell Amateur Radio equipment capable of transmitting
:> to anyone who does not hold a valid Amateur Radio License.

No offense to you personally but it was a pretty stupid rule (my opinion) business-wise. Hmmmm...I see you are now a FORMER 50% owner. Your KEYWORD (above) is "store policy."

I would have just taken my business to another dealer. One of the only things people were buying in your store was CONVENIENCE anyway...cuz you happened to be right there.

:> Now we did not go so far as to say you cannot but a 2M FM rig
:>because you only have a Novice ticket..No..If you held a license you
:>could buy anything in the store...no license...receiving gear only.
:>We were sued by two people who wanted to buy 440 HT's....They
:>lost.

:>I don't know which court that person won in, but I assure
:>you have no legal rights (except for equal housing laws) that can force
:>anyone to sell anything to you if they do not want to....

There ARE free-trade laws that stand in favor of the consumer. One DOES NOT have to have a license in order to purchase transmitting equipment.

One does not have to have a license in order to purchase an automobile. Nor does one have to have a license in order to purchase fishing equipment.

The only time the law would be violated is when the person who bought the equipment used that equipment in a manner that the license was required for to begin with. You know, fishing with no license (if one was required)...driving without a license...transmitting without a license.

Temptation is not a crime.

If there is NO law stating that a person must be licensed in order to purchase a transmitter...then there are no legal grounds for refusing to sell. (I'm not an attorney....just using common sense...and I sell amateur equipment to unlicensed individuals all the time.)

Cheers!

Hi Travis, I sale a book by Artsci "Radio and Tech Mods and Alignments",
(discounted to $17.95) at my web ham store at
http://www.csz.com/sarrio.html. The book shows with diagrams how to expand
the DJ-580t's TX to 130-175 MHZ&410-470 MHz, also RX for Aircraft Band and
800 MHz. The book says cut hte Blue wire for expanded TX and the RED wire
For aircraft and 800 MHz The book doesn't mention an orange wire. Hope
this helps, 73's Ray

Icom IC-901A 2m/440 dual band radio

This is the Icom model the features a remote face so it is easy to mount in a car. You attach a single cable to the radio. On the radio, you have connections for:

2 speakers (main and sub channels)
Mic
440 antenna (N-connector)
2m antenna (PL-259 connector)
12V power

I am included a hand-held DTMF mic with up/down control.

PL encode/decode on both bands

This radio does it all. 2 VFO's for 2m/440 simitanious display. (you can use 2 speakers, one for 2m and one for 440, or hook up a signle speaker for both) 20 memory channels, lighted buttons/display, every setting can be configured, etc.

This radio is in beatiful condition, and never used in a car (I used it in my shack with a 12V PS)

Debts are piling up and I have to sell off my shack. Please make me any offer.

Please make me any offers or questions via email. I do not get a chance to read this newsgroup too often. Thanks!

Ken, KD4FJR

1467. HELP: Heatkit Parts' Informations

Hello. We are looking for informations regarding the following parts for one of my friends' radio:

Heatkit Part No. Manufacturer Mfg. Part No
1. RL1 PN-69-40 Potter & Brumfield MH8054-1
2. RL2 PN-69-17 Potter & Brumfield MH1097-1
3. T1 #54-182 (Power Transformer)

*** Part Nos. 1 and 2 are for Heatkit Model SB-401 Transmitter
*** Part No. 3 is for Heatkit Model SB-620 Scanalyzer

We wish to know where we can purchase those listed above and if you can provide the price will be great.

Thanks in advance and Mabuhay from Philippines.

>

Problems !!! I have had four problems with my new (2 year old) TM-742A :

I have the 220 optional band inserted into my band.

1) Shortly after the 220 option was inserted, I was getting a problem
similar to a cold solder response. Initially, when I turned on the
radio, the 220 band would not transmit when I keyed up the repeater.
At least the radio display didn't indicate it was tramsmitting via
the signal bars on the LCD lighting up, nor did I get any audio
back from the repeater I was accessing. But, as the rig started
to warm up, everything seemed to work properly. I lived with this
for awhile, then it got to be too much of a burden. I sent it to
the Kenwood Service Center and got this problem repaired.
2) When it came back, I experienced another problem immediately. Seems
each band would hold 25 frequencies per band just fine. When I put
in any more per band, phantom indicators would start to appear on the
display, even though that particular feature wasn't activated.
Symptoms were reminiscent of a loose CPU chip. This problem, too,
was fixed by the service center.
3) In unplugging the 8-pin mic and plugging in the 8-pin packet adapter
plug, after awhile the small plastic piece on top breaks off of the
mike jack, rendering the microphone useless. You can either go to
Radio Shack and buy the replacement jack adapter, or give the 1-800
parts number and get a replacement microphone (Part # KT-91-0397-05)
for around $ 85.00.
4) I dropped the removable display on the ground one day (accidentally)
after which time I found out that the display became garbled on the
220 side and the 2 meter middle. I do find that even though the
display is garbled, the radio is allowed to transmit on the band.
I just have to use my imagination on the frequency I program into
the 220 and 2m side of the unit, as it is displayed in a foreign
language. I resort to an external Frequency Counter to help me
tune in my transmitter/receiver pairs, currently.

The first two problems were replaced via a warranty repair during the
first year. The third problem, fixed by myself. The fourth one still
an issue.

Despite these problems, the radio is a dependable unit. It drives a 13-element Yagi with 50 watts just fine. I am able to bring up repeaters 200 miles away easily.

Hope this helps,
Dave KB7PSN

Source record: 212911

In article <Larry_Flader.7.3049348C@mindlink.bc.ca>,
Larry_Flader@mindlink.bc.ca (Larry Flader) writes:

>Hello. I was wondering if anyone has any comments about rapid chargers?
Are
>they good/bad for batteries etc.

Greetings Larry. Why yes I do! I would not own a hand held tranciever
without a rapid charger. I have VERY clear memories of dead battery
packs, and having to wait 14-15 hours for it to charge up again. Major
frustration. Very clear memories. I have the Icom line up, 2at, 3at,
04at, and I have discarded every 14hr charge battery pack I had.

As far as your question about being good/bad, I guess it all depends on
the charger. I haven't heard any horror stories about chargers used for
Amateur radio equipment, but surely somebody has a bad experiance.
Anyway, If the charger is properly designed, and has some kind of fault
protection, then it shouldn't be bad for the battery. There is just to
much information, theory, and mythology about NiCad battery charging to
go into here, but I'll pass along my limited and hopefully not too wrong
knowledge, and no doubt if I'm wrong, I will be corrected. The two main
methods (that I believe) of measuring battery charge are 1, cell
temperature rise above ambiant, and 2, rate-of-change of cell terminal
voltage vs: time and slope change. The terminal voltage will actually go
down when the cell being charged the cell approaches its "full" state.
Each method has it's own advantages and dis-advantages, like anything
else. Charging batteries (a combination of cells) presents addtional
problems too. Charging a single cell is easy. I reccomend you get a
couple of sources of information. See if you can latch on to a data book
from MAXIM. They make all kind of IC's for battery chargers, among other
things, and I think CQ magazine, or more likely (a recent issue of) QST
has had a couple of fair to midlin articles on this subject. Like me, you
will probably learn more about battery chargers than you ever wanted to
know, and certainly more than you need to know. Also, keep your eyes open
for posts from Gary Coffman (??). He responds to these kind of questions
more than I do, and from what I have read, he probably forgot more about
this subject than I know.

Oh yeah, one thing you almost never see mentioned in battery stories, is
the relative capacity of NiCad batteries as compared to alkalines. They
suck, relatively. If you see the need for operating for extended periods
with out the posibility or re-charging, make sure you have an ample
supply, of alkalines and a suitable battery case. Alkalines have about 4
to 5 times the energy capcity (in Joules / Kg-m^3, WattHours/ pound,
AmpHours/ stone-inch^3, whatever) as compared to regular garden variety

NiCads. But!, there is always a but, NiCads can supply more short circuit current than a comparably sized Alkaline due to their lower internal resistance. I don't know about Lithium as compared to Alkaline batteries other than they cost a bunch more.

Before I get beat up too bad, yes there are other methods of measuring cell charge, I know, but they get a little weird IMHO.

Hope I didn't bore you Larry. TTYL

Like he said, "The FCC...

I feel wordy, so let's blather on a bit...

The Class D (Citizens Band) Radio Service was conceived as a personal service, strictly local. I can remember when back in the 23 channel days there were specific channels set aside for business, personal, mobile-mobile, and mobile-base communications. The technical state of the art did not permit close-spaced input/output pairs in such a small freq spectrum, so no provisions were made for it.

Another factor in it was the occaisional skip conditions that occurred. With the Class D range and power limitations, a repeater would have produced widespread interference across a wide area when the band opened.

With the channel use restrictions, spectrum width, and intended use all taken into account, there simply was no reason to allow it, nor any purpose in allowing it.

If you needed the services of a repeater, you went to the commercial radio spectrum, or GMRS (at least I think the allowed repeaters there).

Hope this is a better answer...

Greetings!

After many years of procrastination, I finally took my tests this past weekend and became a licensed ham (Tech-Plus) Now, I need a radio! I already have an HR 2510 for 10-meters (finally, I get to use this "ham radio" on the bands which it was "designed" for ;) but I need an inexpensive 2-meter handheld to get started on VHF. HTX-202 or comparable would be great. Nothing fancy, just a good, solid radio that I can get started with for cheap. Packet capability would be a plus as would driving distance from Charlotte (I've heard too many horror stories about dealing over the Net) Thanks!

Bannold Communications Limited is proud to announce its arrival on INTERNET.

Staff at Bannold can be contacted by mailing "persons name"@bannold.com.
i.e. mick@bannold.com

WHO THE HELL ARE BANNOLD COMMUNICATIONS
and
WHY SHOULD YOU WANT TO CONTACT THEM?

Well, as Trio-Kenwood (UK)'s ONLY OFFICIAL EXPORT DISTRIBUTOR and with a higher turnover of KENWOOD product than any other Kenwood UK dealer, Bannold Communications is in the enviable position of being able to take advantage of volume discounts and offer TRADE PRICES to the General public.

OK Big Deal so you're cheap, but what about support?

Bannold Communications offer the same level of support as any other Kenwood distributor, Bannold
Communications provide full warranty backed by Trio-Kenwood (UK). Warranty claims are handled by
Bannold Communications, on their own premises by fully trained engineering staff with calibrated
test equipment.

Can you pop in for a cup of tea and a chat?

Bannold Communications are Primarily distributors, they move equipment in bulk to destinations
all over the world. The operation is geared to supplying communications solutions to the professional market. There are no Licensed Amateur's on the staff, there are no hospitality facilities.

Bannold Communications are fully authorised to sell and maintain Kenwood Communications equipment, they will advise on official modifications, updates and Official Kenwood engineering
bulletins.

Buying from Bannold means you get what you pay for, No cups of tea, No high street shops, No
hype, lies or exaggerations. You simply get the BEST products at the Keenest prices with FULL
warranty.

We are not trying to entice you away from your local supplier, I doubt that we could !
Its always better to buy from someone you know and trust, especially if they can discuss you
special needs over a hot cuppa.

BUT

If you are thinking of buying that rig on special offer in the mag, or you don't have a good
local dealer then Don't think twice and try us were sure you'll get a
better deal.

1479. FALSE SWR reading on MFJ 962 TUNER ?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-04 00:00:00 UTC
From: esrac@stack.urc.tue.nl
Message-ID: <42eg27$1c4@tuegate.tue.nl>
Source record: 212917

By accident I stumbled accross something strange with my MFJ 962 1.5 kW TUNER. The tuner has a cross needle indicator for FORWARD and REFLECTED power. When tuning an antenna for for minimum SWR the reflected power needle should dip at 0 Watt. This works just fine even when a random lenght of wire is used as a antenna.

Now what did I discover...?

Setup: TS850S <--> AL811A amplifier <--> YS60 SWR/POWER meter <--> MFJ 962

<--> 2 el. Cubical QUAD for 5 bands.

SWR measured with a SWR analyser from MFJ at the antenna showed 1.1:1 50 Ohm on 17 and 20 meters.

SWR on 15 meters was about 1.5:1

Watching the cross-needles of the MFJ I tuned the QUAD on 15 meters to 'no reflected power'. The SWR indicator on the TS850S showed about 1.7:1 .
Checking the SWR on the YS60 showed the same 1.7:1 !!!...??? Then I only watched the YS60 meter and tuned with the MFJ for minimum SWR on the YS60.
The SWR on the TS850 then also diped at 1.1:1.
The MFJ showed about 2:1 SWR. Tuning happened with 50 Watts. There was a pronounced DIP on the YS60 reading while the cross needle of the MFJ did NOT dip at all (it only dips at 0 reflected power)

I suspect that either the measuring circuitry of the MFJ is faulty or simply incorrect designed. I would appreciate any comments on my observations.

Best wishes and 73 de Aurelio pa3ezl/aa2wh

Hey, one more Idea! (to the original poster), go buy a topo map, and clearly mark on the map, in bold red permanant marker, where the transmiter, studio, and antenna will be. This will surely speed up the "process". This will aid the monitoring & signal quality patrol divisions to effectively null out any interference, thereby enabling a better "quatlity of transmission" evaluation. I can't think of any other task that would help with the "proof of perfomance" and THD tests. You certainly don't need some pesky multi-KW foriegn broadcast staion fouling up the test activity.

I currently have two GE MAster EXEC II 460 radios converted to operate
in repeater service on 440. I re-tuned the exciter, per the service
manual and did not touch the PAs. It puts out in excess of the rated
power on both radios. I am not aware of anyone else using the EXEC II
that has had to adjust or change anything with the PAs. You may just
need to fine tune the exciter section. If you need to buy a manual,
E-mail me and I will give you the info. I think mine was under $20.

1485. Re: TM-742A Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-04 00:00:00 UTC
From: HVXN34A@prodigy.com
Message-ID: <42f8km$21pu@usenetw1.news.prodigy.com>
Source record: 212923

I have been using my 742 for nearly 2 years and have not had any problems.
I have remote mounted the control head and that works great also. About
a year ago I added the 1.2ghz module for use on a local repeater here in
SoCal. Again, no problems. Made the mods. No problem. I even moved
the modules around so now it's set up like the 942 (a label on the radio
says not to do this) but it works fine.

A great radio, and the prices seem to be coming down. Kenwood probably
has some new models in the works.

1486. Realistic trc-216 handheld CB xcvr mods for 10 meter band?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-04 00:00:00 UTC
From: alex@anat3d1.anatomy.upenn.edu
Message-ID: <42f99d$q66@netnews.upenn.edu>
Source record: 212924

Anyone know of a receive mod for the above unit? Unfortunately it doesn't have sideband capabilities, so it wouldn't be any good for transmitting, but I thought it might work ok for listening in on the 10 meter band. Any thoughts?

>SSB and CW.

>Not sure how much simplex FM activity there is. As far as repeaters, there
>aren't many on here in the LA area, and this must be the repeater capital of
>the US. There are far more on 1.2 GHz than on 6m.

Yeah, that's too bad, isn't it...?

Here are some LA repeaters that I either have experience with, or have been told
that they are functional by reasonably reputable hams:

52.80RX/52.30TX PL 82.5 N6FFI
52.74RX/52.24TX PL 127.3 N6ENL
52.86RX/52.36TX KC6WGR (So Cal 6m Club)
52.56RX/52.06TX ditto

There are a LOT of remote bases around with 52.525 capability. There's a couple
from Mt Palomar and a couple from Sunset Ridge that pop up now and then...

Source record: 212927

Ed,
I just bought a IC-736 about 6 weeks ago. It was a big step up from
my old Ft-101ee! I think its a great radio, and I enjoy it, but If
I were to do it over, I think I would buy the 738 instead. 6m is nice
to have, but not too much there... The main problem w/ the 736 is the
lack of portability due to the built in power supply... of course, that
is also a feature. Good Luck!

1491. Kenwood SM-230 Question?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-04 00:00:00 UTC
From: herbr@netcom.com
Message-ID: <herbrDEEBLx.KFB@netcom.com>
Source record: 212929

Does the Kenwood SM-230 have the spectrum display capabilities? I thought it did, but I overheard someone sayong that it really was only designed to over basic scoping capabilites, and wasn't a very good spectrum display type device.

I thought this could be used to see band activity on either side of a given frequency, so that if you were listening in the center of a quiet band, you could see a signal blip on either side of you.

I know it does other functions as well, but I was particulary interested in this.

Any other specific comments on this unit would also be apprecaited.

Thanks.

From: herbr@netcom.com
Message-ID: <herbrDEEAxr.IH6@netcom.com>
Source record: 212934

I have just purchased a new Kenwood TS-850S AT. I am interested in hearing from anyone with experience with the narrow SSB or the more narrow cw filters for this radio, with any comments regarding their usefulness and performance.

I am also wondering if the company that used to make filters for Kenwood radios is still in business. I think they were called something like FOx Tango Filters, or a company called IRC somewhere in Florida.

IF so, are these filters "better" than the Kenwood add on filters? Or, are Kenwood's or someone else's better?

Any comments would be apprecaited.

Thanks and 73's.

From: nacec@winternet.com
Message-ID: <42fugh$rv3@blackice.winternet.com>
Source record: 212938

ITS YOUR FAMILY AND YOUR COMMUNITY,
WON'T YOU HELP US TO BETTER SERVE THEM IN A CRISIS.

After a large disaster strikes your community and your family, I am sure you will agree that its a little late to start building a massive rapid response, emergency communications system supported by thousands of people within companies, organizations and serving as volunteers to provide essential support services.

We are The North American Center For Emergency Communications Inc. (NACEC), a Federally registered Non-profit organization serving North America since 1992. We have been developing a system that merges many different technologies to create a unique, high capacity, rapidly deployable solution to the problem of communications outages and shortages that occur following a large disaster. Our volunteer network in using the Internet as its communications backbone, is itself using one of the many technologies employed in NACEC's overall solution.

To help ensure the greatest possible effectiveness in as many communities as possible throughout North America, we are developing a very large volunteer network of community volunteers (Community Ambassadors) who work with our staff and their local communities. If you are community active and are interested in helping, we need your help, NOW. Please, don't wait until disaster strikes, help us to be prepared and be ready to assist your community.

BECOME PART OF THE SOLUTION!

The more communities that are represented by our volunteer network, the more effective we can be in disaster preparedness, emergency operations and in the area of emergency and military family message handling and delivery.

As a NACEC volunteer (Community Ambassador) you will assist with the movement of information that is vital to the continued success and growth of this organization and the survivability of your family and your community following a large disaster.

This project is growing rapidly, as we locate and add new dedicated volunteers from as many communities as possible from across North America. I hope you will join us in making this organization a success.

To find out more about how you can get involved in this project and use your Internet skills to help your community, please review the information that is in our WWW Homepage area which can be found at:

http://www.winternet.com/~nacec/index.html

An electronic volunteer application form can also be found there as well. Should you have any questions, please address them to me at: eaddy@nacec.org

Respectfully,

Mr. Edward Addy
Executive Director

First of all, you need to get an FCC form 610, and make sure that you have a copy of your license. You are still well within the period of grace as far as renewing your amateur privileges, but if I'm not mistaken, you will be issued a new call sign from the current block. As far as the form 610 goes, you can obtain one from the FCC very easily by calling 1-800-418-3676 from a touch tone phone and following the directions. They are very quick about getting the forms out. If you know other hams in the area, they may also be able to help.
Once you fill out the 610, include a copy of your license, send them in to the address on the form, you will be well on your way back into amateur radio. It's good to see someone who has not been active for a while regain interest in the hobby. 73

jackl@pinetree.microserve.com (WB3U) wrote:

>>equipment to unlicensed individuals all the time.)

>That's too bad. Most of the dealers I've known had higher standards.

Why is it an indication of "low standards" to sell to an unlicensed individual? There are at least a few good reasons for an unlicensed individual to buy a rig.

1. People say the best way to learn CW is to listen off the air. Well, that means you need a radio. Granted, receivers are available, but lots of people prefer the all-in-one convenience of a transceiver, which is why they're the most common type of rig. Why not let this person buy a rig to help learn code?

2. Similar reasoning for 2m, to familiarize him/herself with local repeater customs. When the license arrives, the new ham is less likely to be a lid on the repeater, having learned how people use it.

3. As has already been mentioned, as a gift to a ham.

4. Under the current FCC regs, a person has operating authority as soon as the callsign is assigned, and need not wait for the license to arrive in the mail. Without the paper license, however, he has no way to prove to you that he is, in fact, licensed (anyone can make up a callsign, if that's all they have to do). Why won't you let him buy a rig and get on the air?

Most of these miliary rigs can be "converted" to NBFM by placing a series resistor in the mic audio line. This provides a lower amplitude to the modulator, and hence reduced deviation. Start with a 5K pot and a deviation meter, and see if this works for you. If all is well, install a fixed-value resistor in the mic.

From: morganp@fn1.freenet.edmonton.ab.ca ()
Subject: Does anyone know of where I can get a battery cover plate for HTX-202

I would like a battery connection cover plate for my HTX-202 because when I
operate from external power I'm supposed to take the battery pack off but that
leaves the battery connectors to possibly get damaged, any ideas?

You're learning. :-)

However, don't be so dogmatic, Kenwood may (insert miraculous intervention
of the Virgin here) get their act together with VHF/UHF rigs one day.
Remember, it wasn't that long ago when Yaesu couldn't build a HF rig,
now they're the top dog in that department. Changes can happen, so
keep your options open.

Gary

From: billv@olympus.net (Bill Vaughn)
Subject: mfj-8621 packet radio probs

I just received an mfj-8621 packet data radio (after waiting 8 months) I put
new factory xtals in it and retuned the unit. After checking it with my
service monitor I discovered that upon tx key the freq drifted from about 2k
away to an onfrequency condition but it took aprx a second for it to do so.

I am delaying the tx key for that amount of time but it seems to negate the
fast diode switching. It has no heater for the xtal but I have worked on many
radios with no oven that did not do this. Any suggestions for a fix.

>power? More reliablity? Or a waste of money?

The 572B is virtually identical to the 811A but with a much greater
plate dissipation (160W VS 65W). Unfortunately, in order to make use
of that additional dissipation, you need to raise the plate
supply to about 2500V. Personally, I wouldn't spend the extra money
as replacements for the Collins.

>Along the same line, what is the advantage of using a ceramic based
>811A as opposed to the bakelite based ones? I see RF parts advertise
>the ceramic based ones at quite a bit more money..

I'm not aware of any advantages offered by the ceramis base, but maybe
there's another reason for the price difference. Wonder if the
ceramics are U.S. made?

Yes Gary, but the original question was would an internal power supply
improve the RECEIVERS dynamic range, noise floor, etc.

I sure think the correct answer to that question was NO.

>73 Tom

One reason I can think of for that being true, is that most internal
power supplies are better built by the manufacturers than a cheap
external power supply a user may use in some cases. If you use a good
quality external power supply, then the should be no difference in
reception.

Subject: FT530 programming

I have what may be a very unusual but interesting question. A few months
ago,
I encountered a lot of talk about whether memory settings could be cloned
from
one FT530 to another. I believe that the answer was yes and that it could
be
done through the 1/8" jack of the spkr/mic plug. Recently, Yaesu has come
out with the FT51R which is programmable (not just cloneable) through this

plug.
An I correct in assuming that the 51 programming software would work on the
530? What do you think?

From: dave@diusys.cms.udel.edu (Dave Dabell)
Subject: K-com filters and Telephone RFI

Yes, I've used a K-com filter on an at&t trimline-like phone (keypad in
the handset). This was a newer electronic model that had a volume level
switch for rcvd audio. It picked up rf bad enough to hear it across the
room. After installing a K-com at the handset rf could still be heard,
but it was less than 1/2 as loud as the voice at the other end of the
line. Quite a reduction.
Inside the k-com is a torroid with maybe 30 turns of small gauge wire
for each side of the line. So it appears to be just a choke. I assume
it has quite a bit more inductance than you could get by wrapping the
cord around a snap on choke.
Good luck with the rfi. If all else fails, you could always go back to
an old ma bell model. They were pretty rf-proof.

Subject: KENWOOD RELIABILITY

Well Ed,
Out of 5 rigs (TS-440's) we bought, all five failed with the VCO glue. I fixed my own, the rest sent them in for repair. One has been repaired in other ways, but that's because N1JWR won't take the time to get his 13 W/M!!! And so the rig languishes, waiting for a warm hand to carress... but I digress...

My Kenwood 741 has stopped transmitting on the 6 meter module, and now the 2 meter module...

My guess is... they just arn't all that well designed, just adequate for the dainty ham operator. (I'm a HAM fisted 24 hour user...)

On the other hand, NOTHING I've ever owned didn't at one time or another need fixin. Ask me about the ICOM W2A...

Tom

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it.
It does a great job on both CW and SSB, and the noise reduction works
very well. You can hear your sidetone; just set the center frequency
to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned
that you could hear some noise if you cranked the gain way up in the
absence of a signal. The unit's noise is not noticeable at all in
normal operation. I can hear a little bit of noise if I crank it all
the way up with no signal input, but its noise is inaudible if I
feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard,
their DSP probably leaves much to be desired in both performance and
workmanship. Just my $0.02 worth on Mighty Fine Junk.

Actually there are some advantages to the internal supply approach,
but you're right, Tom - it has nothing to do with the location of the
supply. Some of the internal supplies run significantly more than
12-15 volts, and this can be an advantage in some cases. Better IMD
and spectral purity from the PA are easier to achieve at the higher
voltages (28 to 30 volts) that these internal supplies offer. It's
also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The

resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern

since the feedline is now part of the radiating structure.

Subject: Good customer service - ICOM

I can second Gary's comments about ICOM. Right after I purchased my 820H I was attempting the expanded receive mod and slipped with the soldering iron and damaged a diode. Not only did ICOM ship the part to me at no charge, they also shipped a wiring and componet location sheet to assist me.

Gary Fiber in tech support has also been top notch for questions. He even emailed me on a Saturday about a problem I was having with a ICOM amp!

Needless to say I have purchased several ICOM unit since! Customer service is key and ICOM understands it!

Herb, That's about as good as worrying about the color of paint. The
location of the supply and what it plugs into have no effect on the
parameters mentioned.
I can think of threads of logic that may be distorted into forming that
conclusion, but it is a giant leap.

You hear a lot of strange stuff if you listen long enough.

From: dsnowden@ccd.harris.com (Doug Snowden)
Subject: 572B tube in Collins 30L1 ???

Subject says it. Will the 572B tube fit in the 30L1? Physically? It
might be a bit bigger than the 811A tube, I don't know. If it will
fit, is it electrically near the 811A? What is the result, more power?
More reliablity? Or a waste of money?

Along the same line, what is the advantage of using a ceramic based
811A as opposed to the bakelite based ones? I see RF parts advertise
the ceramic based ones at quite a bit more money..

From: "Manuel A. Maseda WF1J" <mmaseda@packet.net>
Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore
power out but they will last forever. Collins recommends that
you change out one of the one of the caps in the 30L-1 for
best operation with a 572B but I've tried them with a stock
unit and it seemed to work fine. If your really interested in
this mod I can dig through my stuff and tell you which cap to
change.

As far as the ceramic based 811A, I've used bakelite 811 and
811A tubes for years and have never found any problems. I
wouldn't spend any extra for a ceramic base but if its the same
price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image
frequency. The C508A first IF is 23.05 MHz, so my guess is that the
images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie
916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S
meter doesn't go to S9, but it seems better than having a mods butcher
pulling such an intricate package apart!

: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then
to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you

were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

You did not say how large a battery you wanted, which would help.
Assuming you are in the market for something other than palm sized you
should try Sears. They have a range of gell cells at attractive prices
available on special order from their auto centers. At least that's
what the flyer they were handing out at the last Miami Boat Show
indicated. Failing Sears, try West Marine or Boat/US. The 800
information operator can give you their numbers.

Subject: Yaesu FT51R

I bought one a couple of weeks ago. I haven't talked much on it, but I
have used it several times in a QSO with a friend on a repeater. On full
5 watts, it seems like it will be useable for at least twenty minutes of
back and forth talking. On the next lower power (3.5 watts, I think) it
seemed like we could just keep talking into the night. The back got a

little warm, but evidently not warm enough to do anything during the 1.5
to 2 hours I was using it.

Subject: 2 Meter + Business VHF

The question is: Are there any radios that can do 2m FM and High Band
commercial?

The Bendix/King and other were mentioned. Add to this the Motorola Saber
handheld.These can be found on the used market. It helps if you have a source
inside of Motorola. If you want a mobile try a Motorola Syntor, and if you
what complete frequency agility as opposed to a prom-bound radio you need to
get yourself an Anaconda control head for the Sytor, I don't have the address
handy but I will post it later.

I've had both here and the MFJ is much better for CW.

>Does the unit generate its own noise? This is really irritating when I
>use an AF to filter out faults in the receiver (hiss, AGC pop) as well as
>for selectivity. I listen with headphones. QST panned the 59+ in this
>area.

I've heard the early 784 sucked in this area, but the 784B I use is very
very quiet.

>How does the unit handle CW spotting?

You push a button and hear a tone that matches the filter center
frequency. Like zero beating.

> Can you hear your own sidetone if it's the same frequency as the
received >signal?

You can either program the sidetone internally or use a T/R line that
bypasses the filter on TX. I bypass mine and run QSK with no problems.

>How well does the noise reducton feature work?

OK, but better with wide selectivity. I think any audio noise limiter is
asking for a lot though!

[snip]

Yep, my ICOM 24-ATs had the same problem. The way I fixed 'em was
to slightly mash the threads on the BNC where the spanner nut holds
the BNC to the case, then torque the nut down as tightly as possible.
Then re-solder the wire inside the case. I had intended to locktite
the BNC but haven't needed to. They are staying in place despite
repeated duckie removal and car antenna hooking. Even the briefcase
bend hasn't bothered them. It's been well over a year since I fixed
them and so far no trouble.
The biggest trouble I have now is the ^%$#@* power jack keeps failing.

Subject: 2m/70cm Handheld Reccomendations ?

Probably a FAQ, but I'm new to HAM....

I just passed my no-code yesterday and am looking to purchase an 2m/70cm
handheld. 1-1/4 would be nice, but... What I would like is to hear from
some experienced handheld users as to the types of features that are
particularly handy (e.g. num. of memories, EEPROM, etc.) Also, if there

are any particular units worth considering, I'd appreciate some input as
to your experience with the units. I appreciate your input. Feel free to
e-mail me, however, I would guess that there are plenty of new HAMs
looking for the same, so a post is preferred.

>this is my experience with them.
>73 gud luck
>kd4gan

Something was wrong with that Isopole, or its feedline. The 440 Isopole
is a very well made antenna, and normally works quite well. (Of course
it doesn't have the gain of a big colinear, but what did you expect?
It should easily outperform a Ringo or a rubber duck.)

The 2m Isopole is a bit cheesier, you have to supply the mast part
yourself. If you put it together right, and get good electrical
connections to the mast you supply, it'll still beat a 2m Ringo
(of course nearly anything will).

Hmmm, it seems I'm damning the Isopoles with faint praise. Well, they
aren't the best antennas out there, and they aren't the cheapest antennas
for what they do, but still they aren't as bad as your experience would
indicate.

From: rfs@usa.net (Rich Scheuerer)
Subject: Equipment donations appreciated

I have recently introduced a number of students, by way of a short class, to amateur radio. The response by them was very positive and I have made one of my goals for this next semester to get a station going for them at the school. Equipment donation of any sort would be very helpful.

The school is called the Challenge School and is a charter school for the Cherry Creek School district located in southeast Aurora, Colorado. It emphasizes education in the sciences and a station would fit right in with not only their curriculum but the interest expressed by many students I have spoken with. The grades of focus are 3rd to 8th, with middle school grades (6,7,8) being where the most interest has been.

For myself, this is a first experience, and am very much looking forward to following thru on this if I can get the needed gear. Unfortunately, there is not any current funding for it so donations is the way to go.

If you have any donations, I will provide you with a receipt clearly indicating the schools appreciation and the approximate value if you would like for tax deductibility. Please enclose the estimated value of the equipment if you have any idea. This station is starting from zero, so anything would be great and we are very much hoping someone has a tranceiver which they would like to pass along to a very curious bunch of kids!

Thanx much,

Rich Scheuerer, K0ZX aka rfs@usa.net

>design from scratch is needed)

Commercial flash converters that can handle HF are rarely over 8 bit
resolution, and that's not nearly enough. A bit of clever scaling
should let you parallel two of these to get 16 bits. But these converters
are still in the $100 range, I think that may be the wrong approach.

A 1 bit flash converter working at HF is rather trivial, even in discretes.
It seems to me that using a heavily oversampled 1 bit converter and
decimation of the resulting bit stream should give us what we want without
needing to wait for the chip makers to give us an integrated solution.
Remember, we only have to sample at a multiple of the receiving *bandwidth*,
and not at a mulitiple of the actual IF frequency because such sampling
aliases down to baseband. Opinions?

From: jeff.sumberg@sailboard.com (JEFF SUMBERG)

Subject: Heathkit HO-10 Monitor Scope question.

I recently bought a Heathkit HO-10 monitor scope at a hamfest. I'd like to locate somebody else with one of these. I have two questions to ask you:

1 - Do you have the manual? I am missing page 41 of my manual. The manual say "Condensed Manual" on the front, and carries the number 595-578-1. I'd like to get the missing page. (scanned->UUencode->Email, or FAX, or mail a copy).

2 - When the scope is in operation, the trace appears as a broken line rather than a solid line from edge to edge. As you turn up the sweep rate, the segments get smaller and more of them appear across the face of the tube (about 2 segments when slow, about 6-10 when at fast sweep). Is this normal operation? The unit works fine, and the displayed patterns look good, except for this "broken up" appearance.

This isn't the way they are shown in the manual which leads me to believe there is some signal, like a square wave, riding on the vertical deflection section (just a guess). I figured before I looked into the unit I'd ask.

Thanks in advance.

From: morganp@fn1.freenet.edmonton.ab.ca ()
Subject: Does anyone know of where I can get a battery cover plate for
HTX-202

I would like a battery connection cover plate for my HTX-202 because when I
operate from external power I'm supposed to take the battery pack off but
that
leaves the battery connectors to possibly get damaged, any ideas?

You're learning. :-)

However, don't be so dogmatic, Kenwood may (insert miraculous intervention
of the Virgin here) get their act together with VHF/UHF rigs one day.
Remember, it wasn't that long ago when Yaesu couldn't build a HF rig,
now they're the top dog in that department. Changes can happen, so
keep your options open.

Gary

From: billv@olympus.net (Bill Vaughn)
Subject: mfj-8621 packet radio probs

I just received an mfj-8621 packet data radio (after waiting 8 months) I put new factory xtals in it and retuned the unit. After checking it with my service monitor I discovered that upon tx key the freq drifted from about 2k away to an onfrequency condition but it took aprx a second for it to do so.

I am delaying the tx key for that amount of time but it seems to negate the fast diode switching. It has no heater for the xtal but I have worked on many
radios with no oven that did not do this. Any suggestions for a fix.

>power? More reliablity? Or a waste of money?

The 572B is virtually identical to the 811A but with a much greater
plate dissipation (160W VS 65W). Unfortunately, in order to make use
of that additional dissipation, you need to raise the plate
supply to about 2500V. Personally, I wouldn't spend the extra money
as replacements for the Collins.

>Along the same line, what is the advantage of using a ceramic based
>811A as opposed to the bakelite based ones? I see RF parts advertise
>the ceramic based ones at quite a bit more money..

I'm not aware of any advantages offered by the ceramis base, but maybe
there's another reason for the price difference. Wonder if the
ceramics are U.S. made?

Yes Gary, but the original question was would an internal power supply
improve the RECEIVERS dynamic range, noise floor, etc.

I sure think the correct answer to that question was NO.

>73 Tom

One reason I can think of for that being true, is that most internal
power supplies are better built by the manufacturers than a cheap
external power supply a user may use in some cases. If you use a good

quality external power supply, then the should be no difference in
reception.

Subject: FT530 programming

I have what may be a very unusual but interesting question. A few months
ago,
I encountered a lot of talk about whether memory settings could be cloned
from
one FT530 to another. I believe that the answer was yes and that it could
be
done through the 1/8" jack of the spkr/mic plug. Recently, Yaesu has come
out with the FT51R which is programmable (not just cloneable) through this
plug.
An I correct in assuming that the 51 programming software would work on the
530? What do you think?

From: dave@diusys.cms.udel.edu (Dave Dabell)
Subject: K-com filters and Telephone RFI

Yes, I've used a K-com filter on an at&t trimline-like phone (keypad in
the handset). This was a newer electronic model that had a volume level

switch for rcvd audio. It picked up rf bad enough to hear it across the room. After installing a K-com at the handset rf could still be heard, but it was less than 1/2 as loud as the voice at the other end of the line. Quite a reduction.
Inside the k-com is a torroid with maybe 30 turns of small gauge wire for each side of the line. So it appears to be just a choke. I assume it has quite a bit more inductance than you could get by wrapping the cord around a snap on choke.
Good luck with the rfi. If all else fails, you could always go back to an old ma bell model. They were pretty rf-proof.

Subject: KENWOOD RELIABILITY

Well Ed,
Out of 5 rigs (TS-440's) we bought, all five failed with the VCO glue. I fixed my own, the rest sent them in for repair. One has been repaired in other ways, but that's because N1JWR won't take the time to get his 13 W/M!!! And so the rig languishes, waiting for a warm hand to carress... but I digress...

My Kenwood 741 has stopped transmitting on the 6 meter module, and now the 2 meter module...

My guess is... they just arn't all that well designed, just adequate for the dainty ham operator. (I'm a HAM fisted 24 hour user...)

On the other hand, NOTHING I've ever owned didn't at one time or another need fixin. Ask me about the ICOM W2A...

Tom

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it. It does a great job on both CW and SSB, and the noise reduction works very well. You can hear your sidetone; just set the center frequency to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned that you could hear some noise if you cranked the gain way up in the absence of a signal. The unit's noise is not noticeable at all in normal operation. I can hear a little bit of noise if I crank it all the way up with no signal input, but its noise is inaudible if I feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard, their DSP probably leaves much to be desired in both performance and workmanship. Just my $0.02 worth on Mighty Fine Junk.

>conclusion, but it is a giant leap.

Actually there are some advantages to the internal supply approach, but you're right, Tom - it has nothing to do with the location of the supply. Some of the internal supplies run significantly more than 12-15 volts, and this can be an advantage in some cases. Better IMD and spectral purity from the PA are easier to achieve at the higher voltages (28 to 30 volts) that these internal supplies offer. It's

also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

>resonant antenna would not need a transmatch. I suspect you have
>standing waves on the feedline and that when you turn up the power
>some of that voltages gets back into the rig and confuses the display.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The
resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern
since the feedline is now part of the radiating structure.

Subject: Good customer service - ICOM

I can second Gary's comments about ICOM. Right after I purchased my 820H I was attempting the expanded receive mod and slipped with the soldering iron and damaged a diode. Not only did ICOM ship the part to me at no charge, they also shipped a wiring and componet location sheet to assist me.

Gary Fiber in tech support has also been top notch for questions. He even emailed me on a Saturday about a problem I was having with a ICOM amp!

Needless to say I have purchased several ICOM unit since! Customer service is key and ICOM understands it!

Herb, That's about as good as worrying about the color of paint. The location of the supply and what it plugs into have no effect on the parameters mentioned.
I can think of threads of logic that may be distorted into forming that conclusion, but it is a giant leap.

You hear a lot of strange stuff if you listen long enough.

From: dsnowden@ccd.harris.com (Doug Snowden)
Subject: 572B tube in Collins 30L1 ???

Subject says it. Will the 572B tube fit in the 30L1? Physically? It
might be a bit bigger than the 811A tube, I don't know. If it will
fit, is it electrically near the 811A? What is the result, more power?
More reliablity? Or a waste of money?

Along the same line, what is the advantage of using a ceramic based
811A as opposed to the bakelite based ones? I see RF parts advertise
the ceramic based ones at quite a bit more money..

From: "Manuel A. Maseda WF1J" <mmaseda@packet.net>
Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore
power out but they will last forever. Collins recommends that
you change out one of the one of the caps in the 30L-1 for
best operation with a 572B but I've tried them with a stock
unit and it seemed to work fine. If your really interested in
this mod I can dig through my stuff and tell you which cap to
change.

As far as the ceramic based 811A, I've used bakelite 811 and
811A tubes for years and have never found any problems. I
wouldn't spend any extra for a ceramic base but if its the same
price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then
to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

Gary

You did not say how large a battery you wanted, which would help.
Assuming you are in the market for something other than palm sized you
should try Sears. They have a range of gell cells at attractive prices
available on special order from their auto centers. At least that's
what the flyer they were handing out at the last Miami Boat Show
indicated. Failing Sears, try West Marine or Boat/US. The 800
information operator can give you their numbers.

Subject: Yaesu FT51R

I bought one a couple of weeks ago. I haven't talked much on it, but I
have used it several times in a QSO with a friend on a repeater. On full
5 watts, it seems like it will be useable for at least twenty minutes of
back and forth talking. On the next lower power (3.5 watts, I think) it
seemed like we could just keep talking into the night. The back got a
little warm, but evidently not warm enough to do anything during the 1.5
to 2 hours I was using it.

Hi Victor,

My first thoughts are: Check to output and make sure your friends radio
is not putting out more than 5 watts..... Also if the temp in the Car
is really hot, the radio will reduce power earlier.

FYI and 73's

>steve
>KA5DLB
>swdecato@nps.navy.mil

Steve, are you sure the battery power is dropping off or is it the
radio that is reducing the transmit power output? I believe the user
manual states that when you use a high power batter pack or DC
adapter, the radio may overheat from the higher power output and when
it overheats, it automatically reduces its output power level. I have
never had mine get hot enough to completely quit transmitting, but it
sounds like that might be your problem. I hope this helps...73's

Hi John,

The PA-10 with a built-in fan was discontinued due to slow sales and high price. The PA-10A (without a fan) replaces the PA-10 with a lower price. Also the new E-DC-12 works great for it's low low price.

From: jeff.sumberg@sailboard.com (JEFF SUMBERG)
Subject: Heathkit HO-10 Monitor Scope question.

I recently bought a Heathkit HO-10 monitor scope at a hamfest. I'd like
to locate somebody else with one of these. I have two questions to ask
you:

1 - Do you have the manual? I am missing page 41 of my manual. The
manual say "Condensed Manual" on the front, and carries the number
595-578-1. I'd like to get the missing page. (scanned->UUencode->Email,
or FAX, or mail a copy).

2 - When the scope is in operation, the trace appears as a broken line rather than a solid line from edge to edge. As you turn up the sweep rate, the segments get smaller and more of them appear across the face of the tube (about 2 segments when slow, about 6-10 when at fast sweep). Is this normal operation? The unit works fine, and the displayed patterns look good, except for this "broken up" appearance.

This isn't the way they are shown in the manual which leads me to believe there is some signal, like a square wave, riding on the vertical deflection section (just a guess). I figured before I looked into the unit I'd ask.

Thanks in advance.

You're learning. :-)

However, don't be so dogmatic, Kenwood may (insert miraculous intervention
of the Virgin here) get their act together with VHF/UHF rigs one day.
Remember, it wasn't that long ago when Yaesu couldn't build a HF rig,
now they're the top dog in that department. Changes can happen, so
keep your options open.

From: billv@olympus.net (Bill Vaughn)
Subject: mfj-8621 packet radio probs

I just received an mfj-8621 packet data radio (after waiting 8 months) I put
new factory xtals in it and retuned the unit. After checking it with my
service monitor I discovered that upon tx key the freq drifted from about 2k
away to an onfrequency condition but it took aprx a second for it to do so.

I am delaying the tx key for that amount of time but it seems to negate the
fast diode switching. It has no heater for the xtal but I have worked on many
radios with no oven that did not do this. Any suggestions for a fix.

>power? More reliablity? Or a waste of money?

The 572B is virtually identical to the 811A but with a much greater
plate dissipation (160W VS 65W). Unfortunately, in order to make use
of that additional dissipation, you need to raise the plate
supply to about 2500V. Personally, I wouldn't spend the extra money
as replacements for the Collins.

>Along the same line, what is the advantage of using a ceramic based
>811A as opposed to the bakelite based ones? I see RF parts advertise
>the ceramic based ones at quite a bit more money..

I'm not aware of any advantages offered by the ceramis base, but maybe
there's another reason for the price difference. Wonder if the
ceramics are U.S. made?

Yes Gary, but the original question was would an internal power supply
improve the RECEIVERS dynamic range, noise floor, etc.

I sure think the correct answer to that question was NO.

>73 Tom

One reason I can think of for that being true, is that most internal
power supplies are better built by the manufacturers than a cheap
external power supply a user may use in some cases. If you use a good
quality external power supply, then the should be no difference in
reception.

Subject: FT530 programming

I have what may be a very unusual but interesting question. A few months ago,
I encountered a lot of talk about whether memory settings could be cloned from
one FT530 to another. I believe that the answer was yes and that it could be
done through the 1/8" jack of the spkr/mic plug. Recently, Yaesu has come
out with the FT51R which is programmable (not just cloneable) through this plug.
An I correct in assuming that the 51 programming software would work on the
530? What do you think?

From: dave@diusys.cms.udel.edu (Dave Dabell)
Subject: K-com filters and Telephone RFI

Yes, I've used a K-com filter on an at&t trimline-like phone (keypad in
the handset). This was a newer electronic model that had a volume level
switch for rcvd audio. It picked up rf bad enough to hear it across the
room. After installing a K-com at the handset rf could still be heard,
but it was less than 1/2 as loud as the voice at the other end of the
line. Quite a reduction.
Inside the k-com is a torroid with maybe 30 turns of small gauge wire
for each side of the line. So it appears to be just a choke. I assume
it has quite a bit more inductance than you could get by wrapping the
cord around a snap on choke.
Good luck with the rfi. If all else fails, you could always go back to
an old ma bell model. They were pretty rf-proof.

Subject: KENWOOD RELIABILITY

Well Ed,
Out of 5 rigs (TS-440's) we bought, all five failed with the VCO
glue. I fixed my own, the rest sent them in for repair. One has been
repaired in other ways, but that's because N1JWR won't take the time to
get his 13 W/M!!! And so the rig languishes, waiting for a warm hand to
carress... but I digress...

My Kenwood 741 has stopped transmitting on the 6 meter module, and now
the 2 meter module...

My guess is... they just arn't all that well designed, just adequate for
the dainty ham operator. (I'm a HAM fisted 24 hour user...)

On the other hand, NOTHING I've ever owned didn't at one time or another
need fixin. Ask me about the ICOM W2A...

Tom

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it.
It does a great job on both CW and SSB, and the noise reduction works
very well. You can hear your sidetone; just set the center frequency
to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned
that you could hear some noise if you cranked the gain way up in the
absence of a signal. The unit's noise is not noticeable at all in

normal operation. I can hear a little bit of noise if I crank it all
the way up with no signal input, but its noise is inaudible if I
feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard,
their DSP probably leaves much to be desired in both performance and
workmanship. Just my $0.02 worth on Mighty Fine Junk.

Actually there are some advantages to the internal supply approach,
but you're right, Tom - it has nothing to do with the location of the
supply. Some of the internal supplies run significantly more than
12-15 volts, and this can be an advantage in some cases. Better IMD
and spectral purity from the PA are easier to achieve at the higher
voltages (28 to 30 volts) that these internal supplies offer. It's
also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The
resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern
since the feedline is now part of the radiating structure.

Subject: Good customer service - ICOM

I can second Gary's comments about ICOM. Right after I purchased my 820H I was attempting the expanded receive mod and slipped with the soldering iron and damaged a diode. Not only did ICOM ship the part to me at no charge, they also shipped a wiring and componet location sheet to assist me.

Gary Fiber in tech support has also been top notch for questions. He even emailed me on a Saturday about a problem I was having with a ICOM amp!

Needless to say I have purchased several ICOM unit since! Customer service is key and ICOM understands it!

Herb, That's about as good as worrying about the color of paint. The
location of the supply and what it plugs into have no effect on the
parameters mentioned.
I can think of threads of logic that may be distorted into forming that
conclusion, but it is a giant leap.

You hear a lot of strange stuff if you listen long enough.

From: dsnowden@ccd.harris.com (Doug Snowden)
Subject: 572B tube in Collins 30L1 ???

Subject says it. Will the 572B tube fit in the 30L1? Physically? It might be a bit bigger than the 811A tube, I don't know. If it will fit, is it electrically near the 811A? What is the result, more power? More reliablity? Or a waste of money?

Along the same line, what is the advantage of using a ceramic based 811A as opposed to the bakelite based ones? I see RF parts advertise the ceramic based ones at quite a bit more money..

Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore power out but they will last forever. Collins recommends that you change out one of the one of the caps in the 30L-1 for best operation with a 572B but I've tried them with a stock unit and it seemed to work fine. If your really interested in this mod I can dig through my stuff and tell you which cap to change.

As far as the ceramic based 811A, I've used bakelite 811 and 811A tubes for years and have never found any problems. I wouldn't spend any extra for a ceramic base but if its the same price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

Cheers,

: >steve
: >KA5DLB
: >swdecato@nps.navy.mil

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then

to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

You did not say how large a battery you wanted, which would help.
Assuming you are in the market for something other than palm sized you
should try Sears. They have a range of gell cells at attractive prices
available on special order from their auto centers. At least that's
what the flyer they were handing out at the last Miami Boat Show

indicated. Failing Sears, try West Marine or Boat/US. The 800
information operator can give you their numbers.

Subject: Yaesu FT51R

I bought one a couple of weeks ago. I haven't talked much on it, but I have used it several times in a QSO with a friend on a repeater. On full 5 watts, it seems like it will be useable for at least twenty minutes of back and forth talking. On the next lower power (3.5 watts, I think) it seemed like we could just keep talking into the night. The back got a little warm, but evidently not warm enough to do anything during the 1.5 to 2 hours I was using it.

From: tigger@jcomm.uoregon.edu (Max Sabo)
Subject: Batt voltage on FT-51R

In the manual it says to display the battery voltage while you transmit (I am assuming that this means it will display it out in the VFO or the memory channels) you need to press the sub-op button before doing the procedure to view the battery voltage (the f-key then 0, dial until you get option 25-batt vol) then press 0 instead of PTT. I have done this many times and it seems just to go back out to the memory channel or VFO, which ever I was in last. Has anyone who owns a Yaesu FT-51R gotten this to work?

Thanks

Subject: Do the manufacturers give a damn?

I had a similar experience with Yaesu about two years ago. I have an FT-101ZD which developed a problem with several of the digits in the display. The part was no longer stocked because of the radios age 20+ years but they sent it to me anyway and free of charge. Tony at the repair center was very courteous and helpful. BTW I still have the 101 on the air and it works great after over 20 years of hamming!

>

I have the Timewave 9+, thier middle unit, and think its fantastic. Works fine and really helps pull the weak ones out of the noise. Use it mostly on CW. I have a Icom IC736 and have some noise from the receiver. When using the Timewave unit, all noise in the background is gone. Nice clear signal and nothing else. Computer is much happier receiving CW with it too!

I did try the Radio Shack, and was disapointed. Then again it was less than half as much. You will be happy with the Timewave unit, which ever unit you do buy.

Hi Jay,

It is not possible to clone the FT-530 to another FT-530. That is why
Yaesu never made a cloning cable for the FT-530. We have tried to make
a PC program for the FT-530, but no luck. The FT-11/41/51 radios were
designed to be PC programmed.

Subject: HF Receiver Question?

Doug Hall (doughall@nando.net) wrote:

: Actually there are some advantages to the internal supply approach,
: but you're right, Tom - it has nothing to do with the location of the
: supply.

Several things can be made to run better if more than 13.8v is
available, obviously PA stages, less obviously RX front ends, but the
thing that makes the biggest improvement is having a higher voltage
supply available to drive the varactor diodes in the synthesiser VCO.
This reduces synthesiser phase noise quite significantly. Only a tiny
current is needed, so it would be possible to have a small inverter in a
13.8v radio, with incredible screening and filtering, of course.
Unfortunately this is almost unknown.

: 12-15 volts, and this can be an advantage in some cases. Better IMD
: and spectral purity from the PA are easier to achieve at the higher
: voltages (28 to 30 volts) that these internal supplies offer.

True, but some manufacturers noted that stage gain and linearity
were improved, so they reduced the amount of feedback around a stage to
trade off the improved linearity into more stage gain still at the old
level of linearity, then used the increased gain to economise by
reducing the number of stages. The result, more profit, same PA IMD.

It's
: also easier to make a 200 watt PA when it runs on 28v, which is why
: the 200w output rigs generally have internal power supplies.

Yes, true. Considering the cost of RF versus power supply devivces,
I'd design a 13.8v mobile radio using a power inverter and a 28/48v PA,
getting some benefits from regulation removing the usual sensitivity to
slight supply variations of the output power.

Higher supply voltges are most attractive for PAs, devices are cheaper, and sometimes available surplus. The circulating currents are less, copper, track, winding losses are reduced. Output transformer ratios are less extreme

I'm unsure of the benefit of 200W output radios. If you want more than 100W, 200W doesn't make much of an improvement, you might just as well go the whole hog, and linear amplifiers are all designed to be driven by 100w radios, anyway. 100 CLEAN Watts seems ideal to me.

Cheers
David GM4ZNX

Gary Coffman (gary@ke4zv.atl.ga.us) wrote:

: Commercial flash converters that can handle HF are rarely over 8 bit
: resolution, and that's not nearly enough. A bit of clever scaling
: should let you parallel two of these to get 16 bits. But these converters
: are still in the $100 range, I think that may be the wrong approach.

Well, the only practical way of using a pair together gives you 9 bits not 16, I'm afraid, unless you go for something pretty involved

A pair could be used in a "Residue converter" scheme where a first pass converter gets the top bits, feeds them to a >16 bit accurate fast DAC, an analogue subtraction removes the DAC output from thesignal which is then amplified and converted in the second stage to get the lower bits...

I'm currently involved with digitising video signals (a much easier task than amateur HF!) and I've got plenty of 10 bit 20 Megasample/sec Analog Devices converters kicking around, and plelty of olf pensioned off 8 bit 20 Megasample/sec flash converters too.

Some of the professional audio 1-bit oversampling devices are beginning to get interesting. AD1879 44.1 kilosample 18 bit jobs could just handle enough bandwidth for a very low IF, but 18 bits is their structural width, and their actual resolution close to the top end of their nyquist bandwidth is getting a bit degraded. I have a few samples left over from an earlier project, so I might have a go with them sometime.

Converter developers have made a push for more bits in the low speed devices, and have been pushing the speed of 8 and 10 bit devices, but they've not been so active in the speed/resolution area I'm looking for because their activities relate to proven market demand. I'm not sure there's much demand for much greater resolution in audio converters considering the 16 bit design of the CD.. it's nice to have some extra margin for overload etc and to allow digital gain control and mixing,

but, I think, they've got enough to satisfy the majority.

: A 1 bit flash converter working at HF is rather trivial, even in discretes.
: It seems to me that using a heavily oversampled 1 bit converter and
: decimation of the resulting bit stream should give us what we want without
: needing to wait for the chip makers to give us an integrated solution.

True, though I wouldn't do he decimation with discretes, although some
audiophile must be beavering away on a thermionic decimator, somewhere..
Using good quality integrators rather than IC process optimised
switched capacitor jobs might be good for the noise floot, too.

: Remember, we only have to sample at a multiple of the receiving *bandwidth*,
: and not at a mulitiple of the actual IF frequency because such sampling
: aliases down to baseband. Opinions?

There are a few snags to using ADC aliases directly, still you can
always come down to a nice low IF...

Cheers
David

From: "Robert A. Kile" <midnight@accessnv.com>
Subject: K-com filters and Telephone RFI

I have found the K-Com filters quite effective when installed per
directions and recomendations. There are 2 types with different frequency
ranges (medium frequency and HF). They work well on common mode currents.

Antenna systems running moderate to high power close household wiring
doesn't help. Try moving antennas away from house if possible. Or, be
prpaired to buy several pounds of snap-on ferrites!

From: "Robert A. Kile" <midnight@accessnv.com>
Subject: Kenwood uses false advertising?

I agree with Joel. The guy who buys a radio with expectations of using
for other than what intended should be able to read specifications
sheets. The net result is that if he can't and bitches to everyone about
it, he is either a gomer or a whiner. Many radios now on the market
require modification to just get extended receive. Some involve the out
of band transmit as well. Seek your own poison. At some point in time FCC
will mandate type acceptance of transmitters requiring that they
absolutely only work on frequencies specified.
The technical whizard who stated that dumping it back on the
manufacturer never made mention that AM at best would require 10uv of

signal to have a demodulation. Also, the technical wizard didn't mention
that he was probably using a antenna cut for 144 and the wrong
polorization as well.

>the MFJ catalog a keyer combined with a Bencher paddle (MFJ-422C). I'd be
>interested in anyone's opinions as to whether this is a good way to go or if I
>should consider something else. Thanks in advance.

Like most things, it's more a matter of preference and opinion than cold hard fact as to which keyer and paddle is best. My preference is a vibroplex iambic paddle and any curtis 8044ABM based keyer. The Curtis 8044 chip is an application specific device that most keyers (including the MFJ you describe, I think) are utilizing. I was heavily into mobile CW for a while and found the BENCHER paddle would "pop its' spring" if I accidentally dropped the keyer off of the front car seat. I like the vibroplex 'cause it is VERY HEAVY and doesnt slide around.

Subject: New Antenna for C508A

For those interested in using BNC antennas on the C508A's SMA connector,
there are adapters available from electronics supply houses at about $40!
I managed to score one for $6 (SMA male to BNC female), plus others at
'OEM parts' in Colorado Springs, (719) 635 0771. (Note I have nothing to
gain from this - just helping out other hams).

Of course, mounting a BNC connector on such a tiny HT tends to stress the
mechanics of the SMA connector. Best way is to let the HT hang off the
BNC antenna .....

Subject: Opinion on Periphex batteries

I purchased a FND-26 battery for my Yeasu ft-530 about one
year ago from Periphex. The price was right, about half what
Yeasu wanted for the same battery.

Recently, the battery quite taking a charge. I have not really
used it that many times (maybe 15-20 charges). I just wanted
to know, is this a case of you get what you pay for or was it
just a fluke that this particular battery went bad.

The battery that came with the radio is still working fine and it
has gone through several more charging cycles than the one
I purchased from Periphex.

Anyone else out there had a good or bad experience with Periphex
batteries.

Subject: Yaesu FT-11R Mods Requested

I got this posting off the oak.oakland.edu ftp server:

>>>

Date: 18 Jan 1994 15:47:44 GMT
From: ijordan@freenet2.scri.fsu.edu (Ian Jordan)
Subject: Yeasu FT-11R Xtend Tx Mod

This mod gives you extended transmission range on a Yeasu FT-11R.

I have knowlege that this mod works, but take no responsibility for any
damage it does to your radio, the legality of this mod, or any other
incurred damages.

After the mod a FT-11R will have:

Recieve: 110.000-135.995 (AM) 136.000-180.000 (FM)
Transmit: 136.000-180.000 (FM)
Empty Memories and a completely reset radio

First, Remove the antenna, battery pack, and pocket clip (if installed)
from the radio. Then remove the four black screws from the corners of
the main section of the radio, the two black screws from the bottom center
section of the main body, and the two silver screws from the bottom of the
keyboard section. Now carefully separate the back and front halves of the
radio, taking care not to put too much strain on the internal ribbon cable,
or loose the small metal strap holder or the battery release button.
Once you have opened the radio, carefully remove the metal plate covering
the back of the keyboard. Then remove the "AF" pcboard by first removing
the two copper screws in the middle of the board, then holding the bottom
of the pcboard and the mic/speaker jacks between your thumb and forefinger
and pulling straight up. This may take a little force, as you are
seperating two connectors. Once you have the "AF" board removed, set it and
the connector/keyboard backplane board aside. Now look at the lower left
corner of the controller board. You should see the 8 jumpers (they are very
small), set up like this:

Top of radio

L A o-o o o E I don't know how the jumpers relate to the
E B o-o o o F ones on the schematic, so the letters are just
F C o o o/o G for reference in this article
T D o-o o o H
"-" means a solder jumper, and "/" means resistor

These are the functions of the jumpers that I know of:
A- Turns your radio into the euro version (TX between 144.000-146.000)
B- ?
C- ?
D- This is the important one. Gives you extened TX range
E- Turns your radio into the 440Mhz version. Not Suggested!
F- ?
G- ?
H- Same as jumper "E"

The only jumper that this mod deals with is "D". It currently has a solder
jumper across it. Remove the solder across the jumper with really small
solder wick or a desoldering station, taking care not to touch any plastic
with your soldering iron. Once this solder jumper is removed, you now
have extened tx range. Now carefully replace the "AF" board first, and
then the connector/keyboard backplane board. Take care to get the copper
grounding connector on the side of the mic/speaker jacks well seated.
Replace the two copper screws in the middle of the "AF" board, and the two
silver screws on the bottom of the keyboard. Replace the battery eject
button and strap holder, and then replace the back half of the radio. Replace all
the screws, put the battery and antenna back on, and turn the radio on.
You should see 144.000 on the screen. Turn the radio off and the hold the
MHZ/\ and MHZ\/ buttons while turning the radio on. You now have the transmit
range between 136.000-180.000.
As a suggestion, you can store completely different transmit and
recieve frequencies in a memory (see manual), so if you store a service
frequency in a memory, you can program a legal HAM frequency as the

transmit freq. so you never accidently transmit on an illegal frequency.

Another neat feature that I have found on these radios is the
"Clone" feature. You can transfer all memories from one FT-11R to
another FT-11R. First, make a cable using two male stereo 1/8"
connectors,
and connecting the top(gound) and middle conductors of the plugs straight
through. Don't connect the tip conductors together though. Plug this cable
into the earphone jacks of the two radios, and on each radio, hold down the
"FM" button while turining it on. You should see every character flashing
on the screen. Now, on the radio which you wish to recieve the memory
contents from the other radio, press the MHZ\/ button. You should see
"RX CLN" on the screen. Then on the radio which is to send it's memory
contents, press the MHZ/\ button. "TX CLN" should appear on the screen for
about 5 seconds, then it should return to the flashing screen state. The
recieving radio should now be in normal operating mode. Turn both radios
off, and remove the cable. That's it. This function overwrites all of
the recieving radio's mem contents, and copies everything from memories
to pager codes to the status of the light. WARNING: The instant that you
hit the MHZ\/, your memories are GONE, even if the transfer is unsuccessful!
Also, both radios must have the same jumper settings to successfully
complete the cloning process.

That's all I know for now! Have fun!

Any other questions? Contact me at "ijordan@freenet.fsu.edu"

Hi Ed,

I can speak for Yaesu USA. I have to admit that we are slow to get on line. But, by year's end we will have a www page for Sales and hopefully service. So please hang in there. You can also reach us at yaesuusa@ix.netcom.com. We try to check email every day but, we travel around the country doing 3-4 shows a month so sometimes it takes 2-4 days for a response. Someday in the future we will have people full time taking service questions via email.

Subject: 2 Meter + Business VHF

The question is: Are there any radios that can do 2m FM and High Band
commercial?

The Bendix/King and other were mentioned. Add to this the Motorola Saber
handheld.These can be found on the used market. It helps if you have a source
inside of Motorola. If you want a mobile try a Motorola Syntor, and if you
what complete frequency agility as opposed to a prom-bound radio you need to
get yourself an Anaconda control head for the Sytor, I don't have the address
handy but I will post it later.

I've had both here and the MFJ is much better for CW.

>Does the unit generate its own noise? This is really irritating when I
>use an AF to filter out faults in the receiver (hiss, AGC pop) as well as
>for selectivity. I listen with headphones. QST panned the 59+ in this
>area.

I've heard the early 784 sucked in this area, but the 784B I use is very very quiet.

>How does the unit handle CW spotting?

You push a button and hear a tone that matches the filter center frequency. Like zero beating.

> Can you hear your own sidetone if it's the same frequency as the received >signal?

You can either program the sidetone internally or use a T/R line that bypasses the filter on TX. I bypass mine and run QSK with no problems.

>How well does the noise reducton feature work?

OK, but better with wide selectivity. I think any audio noise limiter is asking for a lot though!

[snip]

Yep, my ICOM 24-ATs had the same problem. The way I fixed 'em was to slightly mash the threads on the BNC where the spanner nut holds the BNC to the case, then torque the nut down as tightly as possible. Then re-solder the wire inside the case. I had intended to locktite the BNC but haven't needed to. They are staying in place despite

repeated duckie removal and car antenna hooking. Even the briefcase
bend hasn't bothered them. It's been well over a year since I fixed
them and so far no trouble.
The biggest trouble I have now is the ^%$#@* power jack keeps failing.

Subject: 2m/70cm Handheld Reccomendations ?

Probably a FAQ, but I'm new to HAM....

I just passed my no-code yesterday and am looking to purchase an 2m/70cm
handheld. 1-1/4 would be nice, but... What I would like is to hear from
some experienced handheld users as to the types of features that are
particularly handy (e.g. num. of memories, EEPROM, etc.) Also, if there
are any particular units worth considering, I'd appreciate some input as
to your experience with the units. I appreciate your input. Feel free to
e-mail me, however, I would guess that there are plenty of new HAMs
looking for the same, so a post is preferred.

>this is my experience with them.
>73 gud luck
>kd4gan

Something was wrong with that Isopole, or its feedline. The 440 Isopole
is a very well made antenna, and normally works quite well. (Of course
it doesn't have the gain of a big colinear, but what did you expect?
It should easily outperform a Ringo or a rubber duck.)

The 2m Isopole is a bit cheesier, you have to supply the mast part
yourself. If you put it together right, and get good electrical
connections to the mast you supply, it'll still beat a 2m Ringo
(of course nearly anything will).

Hmmm, it seems I'm damning the Isopoles with faint praise. Well, they
aren't the best antennas out there, and they aren't the cheapest antennas
for what they do, but still they aren't as bad as your experience would
indicate.

From: rfs@usa.net (Rich Scheuerer)
Subject: Equipment donations appreciated

I have recently introduced a number of students, by way of a short class,
to amateur radio. The response by them was very positive and I have made one
of my goals for this next semester to get a station going for them at the
school. Equipment donation of any sort would be very helpful.

The school is called the Challenge School and is a charter school for the
Cherry Creek School district located in southeast Aurora, Colorado. It
emphasizes education in the sciences and a station would fit right in with
not
only their curriculum but the interest expressed by many students I have
spoken with. The grades of focus are 3rd to 8th, with middle school grades
(6,7,8) being where the most interest has been.

For myself, this is a first experience, and am very much looking forward to
following thru on this if I can get the needed gear. Unfortunately, there is
not any current funding for it so donations is the way to go.

If you have any donations, I will provide you with a receipt clearly indicating the schools appreciation and the approximate value if you would like for tax deductibility. Please enclose the estimated value of the equipment if you have any idea. This station is starting from zero, so anything would be great and we are very much hoping someone has a tranceiver which they would like to pass along to a very curious bunch of kids!

Thanx much,

>design from scratch is needed)

Commercial flash converters that can handle HF are rarely over 8 bit resolution, and that's not nearly enough. A bit of clever scaling should let you parallel two of these to get 16 bits. But these converters are still in the $100 range, I think that may be the wrong approach.

A 1 bit flash converter working at HF is rather trivial, even in discretes. It seems to me that using a heavily oversampled 1 bit converter and

decimation of the resulting bit stream should give us what we want without needing to wait for the chip makers to give us an integrated solution. Remember, we only have to sample at a multiple of the receiving *bandwidth*, and not at a mulitiple of the actual IF frequency because such sampling aliases down to baseband. Opinions?

From: jeff.sumberg@sailboard.com (JEFF SUMBERG)
Subject: Heathkit HO-10 Monitor Scope question.

I recently bought a Heathkit HO-10 monitor scope at a hamfest. I'd like
to locate somebody else with one of these. I have two questions to ask
you:

1 - Do you have the manual? I am missing page 41 of my manual. The
manual say "Condensed Manual" on the front, and carries the number
595-578-1. I'd like to get the missing page. (scanned->UUencode->Email,
or FAX, or mail a copy).

2 - When the scope is in operation, the trace appears as a broken line
rather than a solid line from edge to edge. As you turn up the sweep
rate, the segments get smaller and more of them appear across the face
of the tube (about 2 segments when slow, about 6-10 when at fast
sweep). Is this normal operation? The unit works fine, and the

displayed patterns look good, except for this "broken up" appearance.

This isn't the way they are shown in the manual which leads me to
believe there is some signal, like a square wave, riding on the
vertical deflection section (just a guess). I figured before I looked
into the unit I'd ask.

Thanks in advance.

You're learning. :-)

However, don't be so dogmatic, Kenwood may (insert miraculous intervention
of the Virgin here) get their act together with VHF/UHF rigs one day.
Remember, it wasn't that long ago when Yaesu couldn't build a HF rig,
now they're the top dog in that department. Changes can happen, so
keep your options open.

From: billv@olympus.net (Bill Vaughn)
Subject: mfj-8621 packet radio probs

I just received an mfj-8621 packet data radio (after waiting 8 months) I put
new factory xtals in it and retuned the unit. After checking it with my
service monitor I discovered that upon tx key the freq drifted from about 2k
away to an onfrequency condition but it took aprx a second for it to do so.

I am delaying the tx key for that amount of time but it seems to negate the
fast diode switching. It has no heater for the xtal but I have worked on
many
radios with no oven that did not do this. Any suggestions for a fix.

>power? More reliablity? Or a waste of money?

The 572B is virtually identical to the 811A but with a much greater
plate dissipation (160W VS 65W). Unfortunately, in order to make use
of that additional dissipation, you need to raise the plate
supply to about 2500V. Personally, I wouldn't spend the extra money
as replacements for the Collins.

>Along the same line, what is the advantage of using a ceramic based
>811A as opposed to the bakelite based ones? I see RF parts advertise
>the ceramic based ones at quite a bit more money..

I'm not aware of any advantages offered by the ceramis base, but maybe
there's another reason for the price difference. Wonder if the
ceramics are U.S. made?

Yes Gary, but the original question was would an internal power supply
improve the RECEIVERS dynamic range, noise floor, etc.

I sure think the correct answer to that question was NO.

>73 Tom

One reason I can think of for that being true, is that most internal
power supplies are better built by the manufacturers than a cheap
external power supply a user may use in some cases. If you use a good
quality external power supply, then the should be no difference in
reception.

Subject: FT530 programming

I have what may be a very unusual but interesting question. A few months ago,
I encountered a lot of talk about whether memory settings could be cloned from
one FT530 to another. I believe that the answer was yes and that it could be
done through the 1/8" jack of the spkr/mic plug. Recently, Yaesu has come
out with the FT51R which is programmable (not just cloneable) through this plug.
An I correct in assuming that the 51 programming software would work on the
530? What do you think?

From: dave@diusys.cms.udel.edu (Dave Dabell)
Subject: K-com filters and Telephone RFI

Yes, I've used a K-com filter on an at&t trimline-like phone (keypad in
the handset). This was a newer electronic model that had a volume level
switch for rcvd audio. It picked up rf bad enough to hear it across the
room. After installing a K-com at the handset rf could still be heard,
but it was less than 1/2 as loud as the voice at the other end of the
line. Quite a reduction.
Inside the k-com is a torroid with maybe 30 turns of small gauge wire
for each side of the line. So it appears to be just a choke. I assume
it has quite a bit more inductance than you could get by wrapping the
cord around a snap on choke.
Good luck with the rfi. If all else fails, you could always go back to
an old ma bell model. They were pretty rf-proof.

Subject: KENWOOD RELIABILITY

Well Ed,
Out of 5 rigs (TS-440's) we bought, all five failed with the VCO
glue. I fixed my own, the rest sent them in for repair. One has been
repaired in other ways, but that's because N1JWR won't take the time to
get his 13 W/M!!! And so the rig languishes, waiting for a warm hand to
carress... but I digress...

My Kenwood 741 has stopped transmitting on the 6 meter module, and now
the 2 meter module...

My guess is... they just arn't all that well designed, just adequate for
the dainty ham operator. (I'm a HAM fisted 24 hour user...)

On the other hand, NOTHING I've ever owned didn't at one time or another
need fixin. Ask me about the ICOM W2A...

Tom

|> Thanks Gary WB7FCQ

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it.
It does a great job on both CW and SSB, and the noise reduction works
very well. You can hear your sidetone; just set the center frequency
to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned
that you could hear some noise if you cranked the gain way up in the

absence of a signal. The unit's noise is not noticeable at all in
normal operation. I can hear a little bit of noise if I crank it all
the way up with no signal input, but its noise is inaudible if I
feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard,
their DSP probably leaves much to be desired in both performance and
workmanship. Just my $0.02 worth on Mighty Fine Junk.

Actually there are some advantages to the internal supply approach,
but you're right, Tom - it has nothing to do with the location of the
supply. Some of the internal supplies run significantly more than
12-15 volts, and this can be an advantage in some cases. Better IMD
and spectral purity from the PA are easier to achieve at the higher
voltages (28 to 30 volts) that these internal supplies offer. It's
also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

>resonant antenna would not need a transmatch. I suspect you have
>standing waves on the feedline and that when you turn up the power
>some of that voltages gets back into the rig and confuses the display.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The
resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern
since the feedline is now part of the radiating structure.

Herb, That's about as good as worrying about the color of paint. The
location of the supply and what it plugs into have no effect on the
parameters mentioned.
I can think of threads of logic that may be distorted into forming that
conclusion, but it is a giant leap.

You hear a lot of strange stuff if you listen long enough.

From: dsnowden@ccd.harris.com (Doug Snowden)
Subject: 572B tube in Collins 30L1 ???

Subject says it. Will the 572B tube fit in the 30L1? Physically? It might be a bit bigger than the 811A tube, I don't know. If it will fit, is it electrically near the 811A? What is the result, more power? More reliablity? Or a waste of money?

Along the same line, what is the advantage of using a ceramic based 811A as opposed to the bakelite based ones? I see RF parts advertise the ceramic based ones at quite a bit more money..

Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore power out but they will last forever. Collins recommends that you change out one of the one of the caps in the 30L-1 for best operation with a 572B but I've tried them with a stock unit and it seemed to work fine. If your really interested in this mod I can dig through my stuff and tell you which cap to change.

As far as the ceramic based 811A, I've used bakelite 811 and 811A tubes for years and have never found any problems. I wouldn't spend any extra for a ceramic base but if its the same price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then

to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

You did not say how large a battery you wanted, which would help.
Assuming you are in the market for something other than palm sized you
should try Sears. They have a range of gell cells at attractive prices
available on special order from their auto centers. At least that's
what the flyer they were handing out at the last Miami Boat Show

indicated. Failing Sears, try West Marine or Boat/US. The 800
information operator can give you their numbers.

Subject: Yaesu FT51R

I bought one a couple of weeks ago. I haven't talked much on it, but I have used it several times in a QSO with a friend on a repeater. On full 5 watts, it seems like it will be useable for at least twenty minutes of back and forth talking. On the next lower power (3.5 watts, I think) it seemed like we could just keep talking into the night. The back got a little warm, but evidently not warm enough to do anything during the 1.5 to 2 hours I was using it.

Hi Victor,

My first thoughts are: Check to output and make sure your friends radio
is not putting out more than 5 watts..... Also if the temp in the Car
is really hot, the radio will reduce power earlier.

FYI and 73's

Hi John,

The PA-10 with a built-in fan was discontinued due to slow sales and high price. The PA-10A (without a fan) replaces the PA-10 with a lower price. Also the new E-DC-12 works great for it's low low price.

I've got a Yaesu ft728 which appears to be the Japanese domestic model of the ft470 (how it came to be in Australia is anyone's guess).

As others have noted, handheld + antennae + pagers etc = mush.
2m is unuseable in the central city area of Melbourne (pop 3M) due to pagers on 148.0075 and up. But then few 2m radios seem to cope in central Melbourne, thats why we use a dual band radio, for 70cm.

Although people say to watch out for "twin banders" vs "dual banders" etc, I have never in fact encountered a 2 band radio which will not recieve both bands at once.

The 728/470 will recieve nboth bands at once but feeds them both to the same speaker. There is a balance control to alter the volume of each band at the one speaker.

Apparently some radios will recieve two frequencies in the same band at once.

Lots of memories are nice, the 728/470 has 18 per band and most of them are occupied on mine. Curiously though, the truth is that most of my operating is on just one local 2m simplex frequency; I rarely venture onto repeaters or 70cm.

Bells and whistles worth having include battery save functions, DTMF (in the states, not so useful in Aus), CTCSS (useful if people you talk to regularly have it).

Spaeker mike is useful, radio in inside pocket, mike on helmet strap when riding motorbike, radio in pack when skiing etc.

Extra battery pack is near essential, always charge flat battery immediately and carry it, always use a battery until flat, then change

battery and charge the flat one that evening. This way you always have a charged battery, you don't lose track of what is charged and what isn't, and you don't recharge half flat batterys (a big no no with ni cads)

A "better rubber duck" is a bonus too. I have an antenna which is about a quarter wave on 2m and 5/8 on 70cm which works well but pokes in my ears, eyes and nose if I put the radio in my inside coat pocket. Works well when packed near the top of a pack. This cost about $30 in Aus, so something similar should be about US$15-20 for you.

Have fun. Spend lots of money, you get about 150 to 200 percent of what I can get for the same money her in Aus! (Jealous)

Check the internal lithium battery - it is used to maintain the memory. I had one once which was disconnected (solder joint broke due to dropping of the radio). Resoldering took care of the memory loss. The battery might just be weak - check the voltage, but I don't remember what voltage it should be.

Why do you want to play music to Pirates. They are almost extinct. I would try country western or rock and roll for the general population. There are some pirates in Indonesia and the South China Sea. I think they like Chinese music. I would buy a big audio amplifier like a Marshall guitar amp and hook it through a tuned circuit to an antenna. The best way to install the antenna is throw the end of a wire over a power line. The entire power line radiates. Try to pick a big metal tower one. They radiate a much stronger signal. Be sure you throw hard enough the wire misses the hot lines and only hits the ground. Wear rubber gloves to be safer. Good luck we kneed more people like you.

Medium mu triode. It requires a lot of bias voltage in grounded grid. It has a 7.5 volt 50 amp filament and is stable when used in grounded grid. It has fairly low gain and a high driving impedance.

A tube ending in 7 is much better, like the 3CX3000F7 (leads) or A7 (coaxial base).

You can make ohm meter tests but the wont tell much. You need to run the tube. 73 Tom

1528. Re: FALSE SWR reading on MFJ 962 TUNER ?

>
Aurelio,

SWR readings always seem to be in disagreement. My ICOM 751A disagrees with my Drake W-7 meter the same way, and my Bird 43 disagrees with both. There are several problems that cause this. In your case it sounds like the bridge in the MFJ is the most improperly adjusted item, or perhaps the cables and devices between the tuner and other meters are changing the SWR.

I assume you have tried a different length cable between the tuner and the radio or external SWR meter? If changing the length of that cable makes the SWR meters change in the radio or the YS60, then the wiring and the meters have different impedances. The cables used in stations are sometimes not exactly 50 ohms, and that makes different meters disagree in SWR. If the line goes through several UHF connectors (they have a Zo of 20-35 ohms) and perhaps a typical manual antenna switch the SWR usually changes a very noticable amount.

The factory calibration depends on the skill or care of the worker involved and the equipment they use. Most meters have a small capacitor you should adjust for 1:1 with a 50 ohm perfect termination. This should usually be done at or above the middle of the frequency range of the meter

so the error is the same on both ends. You could make this adjustment if you have a good reference meter or a good load.

All bridges also have some errors, and the errors can be in different directions. One bridge may zero at 45 ohms, and another may zero at 55 ohms. That would make it appear the error is greater than it really is. You need an accurate standard to use.

But then look at dummy loads, many dry loads are over 1.4 : 1 on ten meters! The Heath Cantenna I have is a 1.3 to 1 on ten meters. The Bird load I have is flat, but it costs over two thousand dollars.

You could check the meters on 14 MHz by paralleling two good 50 ohm loads and seeing if the SWR read 2:1. If you had a good high power 100 ohm load (or an unterminated high power 5 dB attenuator) you could test the opposite 2:1 SWR point.

The real wild thing is none of this makes a noticable difference in your signal, and all the rig cares about is that it is "happy". My ICOM is happiest (the most output) with a low Z load, around 35-40 ohms. My Yaesu with just over 50 ohms. I'm sure the AL-811 you use doesn't care what the load SWR is so long as the internal tank capacitors will match it!'

'I hope this is understandable.

1529. TM742A 1.2 transmit problem

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-05 00:00:00 UTC
From: drp@netcom.com
Message-ID: <drpDEFv8w.ErM@netcom.com>
Source record: 212827

I have a TM 742A radio. The 1.2 gig module, powers up changes frequencies and received great. The problem is transmit. When I key the mic and transmit into an antenae or dummy load there is no power output. When I place an HT nect to the radio it will key up the HT. It apears to be putting some signal but not a measureable amount. I have tried it in high and low power mode. I installed the module as per instructions. It had been working earlier with the previous owner. He removed the module, when I originally bought just the 1.2 gig module. Then I purchased the rest of the radio from him. Is there a reset or something to do that would enable the power output ? Also if the final is blown, how might I determine that and get a replacement part etc ? Your assistance is appreciated.

: Hi,
: Your friends problem is the 3rd instance I have heard of this. My own 2 yr old
: 290mkII has not exhibited the problem. Interesting. He may try a series
: resistor in the lamp lead.

: Joe - AA3GN

Ft 290 mkI does this too. If I could only get mine fixed for $30!...
Some years ago the problem did the rounds on packet. The resistor in series was suggested, but the most elegant solution I saw was to use a clear LED.
Another problem I had at the time was the contacts on the transmit relay getting crappy - no transmit. Pull the top off the relay to clean the contacts or fit a new relay.

:>That's too bad. Most of the dealers I've known had higher standards.
:>73,
:>Jack WB3U

Naw! Just like many, many others who post in cyberspace you let your emotions cloud your good judgement. Just because YOU, personally, do not like the idea doesn't mean that it is illegal.

Too bad most of the dealers you've known are either out of business or are small potatoes...you probably can't or won't even tell us who they are...because it's not the truth. Call some of the larger dealers, like HRO or AES, and ask them if they refuse to sell to non-licensed individuals. Then ask them, "Why not?"

Since many of us get into throwing non-related ideas into the arena why don't we just have those who are not licensed to fish get rid of their fishing gear or be prohibited from buying it?

Jack, will you please tell me what laws there are prohibiting the sale of amateur equipment to non-licensed individuals? Just because someone "owns" merchandise doesn't give the absolute right to refuse to sell it to anyone... That would open the door to a discrimination lawsuit, don't ya think?

Have a nice day...uhh..unless, of course, you have other plans. ;-D

Cheers!

I purchased the Icom IC-2700 recently and I am here pleased with this unit. It

has a removable face plate as well as a built in duplexer. I have no intermod
problems on 2m and very slight on 440.
Enjoy

>power? More reliablity? Or a waste of money?

The 572B is virtually identical to the 811A but with a much greater
plate dissipation (160W VS 65W). Unfortunately, in order to make use
of that additional dissipation, you need to raise the plate
supply to about 2500V. Personally, I wouldn't spend the extra money
as replacements for the Collins.

>Along the same line, what is the advantage of using a ceramic based
>811A as opposed to the bakelite based ones? I see RF parts advertise
>the ceramic based ones at quite a bit more money..

I'm not aware of any advantages offered by the ceramis base, but maybe
there's another reason for the price difference. Wonder if the
ceramics are U.S. made?

Yes Gary, but the original question was would an internal power supply
improve the RECEIVERS dynamic range, noise floor, etc.

I sure think the correct answer to that question was NO.

One reason I can think of for that being true, is that most internal
power supplies are better built by the manufacturers than a cheap
external power supply a user may use in some cases. If you use a good
quality external power supply, then the should be no difference in
reception.

From: dave@diusys.cms.udel.edu (Dave Dabell)
Subject: K-com filters and Telephone RFI

Yes, I've used a K-com filter on an at&t trimline-like phone (keypad in
the handset). This was a newer electronic model that had a volume level
switch for rcvd audio. It picked up rf bad enough to hear it across the
room. After installing a K-com at the handset rf could still be heard,
but it was less than 1/2 as loud as the voice at the other end of the
line. Quite a reduction.
Inside the k-com is a torroid with maybe 30 turns of small gauge wire
for each side of the line. So it appears to be just a choke. I assume
it has quite a bit more inductance than you could get by wrapping the
cord around a snap on choke.
Good luck with the rfi. If all else fails, you could always go back to
an old ma bell model. They were pretty rf-proof.

Subject: KENWOOD RELIABILITY

Well Ed,
Out of 5 rigs (TS-440's) we bought, all five failed with the VCO
glue. I fixed my own, the rest sent them in for repair. One has been
repaired in other ways, but that's because N1JWR won't take the time to
get his 13 W/M!!! And so the rig languishes, waiting for a warm hand to
carress... but I digress...

My Kenwood 741 has stopped transmitting on the 6 meter module, and now
the 2 meter module...

My guess is... they just arn't all that well designed, just adequate for
the dainty ham operator. (I'm a HAM fisted 24 hour user...)

On the other hand, NOTHING I've ever owned didn't at one time or another
need fixin. Ask me about the ICOM W2A...

Tom

Gary,

I bought a DSP-59+ a few weeks ago and have been very pleased with it.
It does a great job on both CW and SSB, and the noise reduction works
very well. You can hear your sidetone; just set the center frequency

to your sidetone frequency.

QST didn't actually pan it for its noise, IMHO. Their review mentioned
that you could hear some noise if you cranked the gain way up in the
absence of a signal. The unit's noise is not noticeable at all in
normal operation. I can hear a little bit of noise if I crank it all
the way up with no signal input, but its noise is inaudible if I
feed it audio from the receiver, even with the RF gain all the way down.

I'm not very impressed with most MFJ stuff, and from what I've heard,
their DSP probably leaves much to be desired in both performance and
workmanship. Just my $0.02 worth on Mighty Fine Junk.

Actually there are some advantages to the internal supply approach,
but you're right, Tom - it has nothing to do with the location of the
supply. Some of the internal supplies run significantly more than
12-15 volts, and this can be an advantage in some cases. Better IMD
and spectral purity from the PA are easier to achieve at the higher
voltages (28 to 30 volts) that these internal supplies offer. It's
also easier to make a 200 watt PA when it runs on 28v, which is why
the 200w output rigs generally have internal power supplies.

A resonant antenna can indeed need a transmatch. All resonance means
is that there's no net reactive component at the feedpoint. The
resistive component could be anything, depending on the particular
antenna geometry, and may need a transmatch to transform that impedance
to 50 ohms. In the case of a G5RV, it's longer than a halfwave
on 20 meters, 3/2-waves in fact. The feedpoint impedance should be
moderate, somewhere not too far from 50 ohms, but the G5RV is fed
with a 300 ohm balanced line section terminated into a coax. You're
not going to get 1:1 SWR on that balanced line (and probably not
on the coax either).

The fact that the line has SWR, however, has nothing to do with
RF in the shack. That's a balance problem, not a matching problem.
SWR on the line just means there are circulating differential
currents *inside* the line that form a standing wave pattern.
They can't get *out* of the line to cause a hot chassis unless
there is a system imbalance and parallel currents are flowing
on the *outside* of the coax. (From the point of view of currents
flowing inside coax, it is a balanced line. It's only for currents
flowing on the outside of the coax that imbalance is an issue.)

There are two kinds of balance involved here, physical and electrical.
Physical balance is important because the induction field can induce
a common mode current on the coax shield. Electrical balance is important
because it can upset the differential current balance of the feedline.

Physical balance is a matter of laying out the antenna and feedline
in a symmetrical manner, IE both legs of the antenna need to be mirror
images of each other with respect to themselves and to Earth, and the
feedline should be routed to bisect that symmetry.

Electrical symmetry is pretty much automatic if physical symmetry is
followed with regard to the antenna and the balanced line section.
The point where the coax attaches, however, can create an electrical
imbalance because shield currents can flow on both the inside and
outside of the shield at this connection point. This creates an
imbalance with respect to the currents flowing in the inner conductor.
A choke balun here (6 to 8 tight turns of the coax will do) will
restore the balance by stopping currents from flowing on the outside
of the shield.

>You might be able to make a virtual ground by attaching a 1/4
>wavelength (at operating frequency) piece of wire to the rig and just
>run it along the baseboard of the shack.

This may treat the *symptom*, but it doesn't address the cause.
A bilaterally symmetric antenna does not need a ground, virtual
or real, in order to perform properly. It's usually wise to
treat the brain tumor rather than just taking aspirn to suppress
the pain. Reserve grounds, virtual or otherwise, for feeding
asymmetric antennas like longwires. *They* need that current
mirror to replace the other half of their symmetry. If you
try to compensate for a hot shield with a balance wire, you
are still screwing up the antenna's design radiation pattern
since the feedline is now part of the radiating structure.

Subject: 572B tube in Collins 30L1 ???

Doug,

572B will work just fine in a 30L-1. You won't get anymore power out but they will last forever. Collins recommends that you change out one of the one of the caps in the 30L-1 for best operation with a 572B but I've tried them with a stock unit and it seemed to work fine. If your really interested in this mod I can dig through my stuff and tell you which cap to change.

As far as the ceramic based 811A, I've used bakelite 811 and 811A tubes for years and have never found any problems. I wouldn't spend any extra for a ceramic base but if its the same price, why not!

From: nepaleduc@aol.com (Nepal educ)
Subject: 800 MHz mod - C508A

Hi,

I have noted that my C508A picks up cellular conversations on the image frequency. The C508A first IF is 23.05 MHz, so my guess is that the images will be 46.1 MHz higher than the 870-890 MHz cell site outputs, ie 916.1MHz to 936.1 MHz. Set the frequency offset to 30 KHz and snoop away!

The image sensitivity is of course not good - I live on a hill and the S meter doesn't go to S9, but it seems better than having a mods butcher pulling such an intricate package apart!

Cheers,

From: brooney@aol.com (BROONEY)
Subject: Accuracy of Autek WM-1 at QRP

I was wondering whether anyone had any fact (or opinion) about the
accuracy of this wattmeter at less than 5 watts. I have both QRP and
regular 100 watt rig. Would like a wattmeter for both but accuracy at QRP
level is most important. Or...do I need to get a QRP wattmeter (I
understand Oak Hills has one).

Thanks

Bill/KG8HR

Subject: Someone wanted IC-2GXAT mods

Somebody was looking for mods for the IC-2GXAT about 2 weeks ago. Here are the ones I know about:

IC-2GXAT mods:
1) Extended rx (136-180 Mhz): Hold down F-Scan-Duplex keys at same time and turn radio ON. Or, cut diode D13 on logic unit.
2) Extended tx. Cut diode D14 on logic unit.
I have done the keypad mod for extended rx and it works without any mishap to the radio. 73/Terry VE4UC

: >steve
: >KA5DLB
: >swdecato@nps.navy.mil

: Steve, are you sure the battery power is dropping off or is it the
: radio that is reducing the transmit power output? I believe the user
: manual states that when you use a high power batter pack or DC
: adapter, the radio may overheat from the higher power output and when
: it overheats, it automatically reduces its output power level. I have
: never had mine get hot enough to completely quit transmitting, but it
: sounds like that might be your problem. I hope this helps...73's
: Floyd WD5ENJ

I'll add my two-cents worth here. You are both partially right.
I have had my FT51R heat up enough to shift to low power and then

to stop transmitting. You will notice that it is in low power
because the transmit scale will be half or a quarter of what it
would be in full power. When it finally overheats, it will actually
stop transmitting. That is your red transmit light will switch
to green even though you have the PTT pressed.

Unfortunately, except for the blisters on your palms, the transition
to low power and then no power associated with over heating is
indistinguishable from the same transitions you would see if you
were on low battery.

To answer the original question, my understanding is that the EDC-12
is a trickle charge, but that it does not bypass the battery, so you
can at high power draw more current from the battery than it is putting
in. I use the bulkier PA-10A, which does give you full power bypass
and trickle charge.

I hope that helps, and by the way, has anyone come up with a heat sync
for this radio? I have a couple of drawings, but I don't know what
material to use. Currently, I have had some sucess wrapping an ice
cube in a paper towel, and rubbing along the back of the radio. This
works best if you remove the belt clip and use a speaker mike. I know
that this is unworkable for most folks, but it does work in a pinch.
As long as you keep the radio dry, you can pull a lot of heat out
of the radio in a few seconds.

Overloads easily, and has a terrible noise figure. Mutek (England)
has a replacement front end board that will fix this radio. I've
used it in a IC211, and it does wonders for strong signal handling
and for reducing the system noise figure.

You did not say how large a battery you wanted, which would help.
Assuming you are in the market for something other than palm sized you
should try Sears. They have a range of gell cells at attractive prices
available on special order from their auto centers. At least that's
what the flyer they were handing out at the last Miami Boat Show

indicated. Failing Sears, try West Marine or Boat/US. The 800
information operator can give you their numbers.

Subject: Yaesu FT51R

I bought one a couple of weeks ago. I haven't talked much on it, but I have used it several times in a QSO with a friend on a repeater. On full 5 watts, it seems like it will be useable for at least twenty minutes of back and forth talking. On the next lower power (3.5 watts, I think) it seemed like we could just keep talking into the night. The back got a little warm, but evidently not warm enough to do anything during the 1.5 to 2 hours I was using it.

From: swdecato@nps.navy.mil
Subject: Batt voltage on FT-51R

Minor annoyance with my FT-51R. I am using the large battery which gives
the full 5w output. Fully charged the voltage indicates 11.4 volts. Without
transmitting I get about 2 full days of usage (monitoring) before I have to
recharge. The low battery indicator blinks just about 3 seconds before
the display blinks and dies. That's not enough warning (and that assumes
you had your eyes on the display when it happens). Mine quits when the
voltage drops to 7 volts.

I too have the heat problem when running the radio using the EDC-12 in
my car at high power. I try not to use high power because it sucks the
battery dry so fast, its not worth it. I've tried all the battery saver options
and still have the same problem.

On the lower power settings the radio is much more reliable. It is extremely
easy to operate. The manual is not needed for most features.

I have rigged up an external 12v nicad power pack to use with the EDC-12
to see if I can get around my battery problems.

A suggestion for the fellow who complains of burning his hands when in
the car... I use a speaker/mike (and leave it on a lower power setting).
Also try to position the radio near your air conditioning duct.

Subject: DSP Filter Advice??

tuck@europa.com wrote:
>I operate CW most of the time and am interested in either the Timewave 59+
>or MFJ 784B. Any advice? The areas of most concern are:

It seems to me that the responses you have received pretty much tell a tale of their own .. that is, that not everyone likes the same piece of equipment.

Everyone has their own reasons for liking one box over another. And of course, whatever they have ended up with is "the best". I ran an NIR-10 and the older DSP-59 (no "+") side by side for months. Sometimes one was "better" than the other in some specific respect on that day with those band conditions, sometimes the other way around. Every one of the boxes is a compromise one way or the other -- if they weren't, you and I couldn't afford to buy one. I finally parted with the NIR-10, but not because it was a crummy product -- only because for MY needs, the DSP-59 represented a better set of compromises. I currently use a DSP-59+ and I'm happy with it, but I'm also itching to get my hands on an NIR-12 to see how that one plays.

The early MFJ "Super DSP" was really crummy in a lot of ways. Tried one briefly and moved on quickly! Sounds like they may have improved things in the "B" version.

You'll never know which one is best for you unless you try them all side by side. So the way out is to pick one and run it for a while and see if YOU like it. 'Cuz what I like, or what somebody else likes may not be what you're gonna like.

And you'll always wonder if the grass might have been greener with the one you didn't buy :-) :^} ....

Subject: Heathkit HT

I have a Heathkit dual band HT I want to use in my car. I have long since lost the manual.

Does anyone know if I can use a radio shack HTX202 12V adapter and speaker/mic with the Heathkit (Its got a 12V in plug on the side), or if the heathkit needs some special device to hook it to a car battery?

Subject: Help with no-code survey..

Thanks for reading this, my name is Russell Gore and I am a student at DeVry Institute of Technology in Phoenix. Part of my technical writing class is a survey, please complete the following survey and mail it back to me at RUSS@PRIMENET.COM thanks..

What class of license do you hold?
Do you support the idea of no-code on HF? Why?

****
Please send answer for the two questions to RUSS@PRIMENET.COM

From: herbr@netcom.com (Herb Rosenberg)
Subject: HF Receiver Question?

I was listening to a conversation on 75 meters the other day. These two guys were talking about the best HF transcievers on the market, and one of them made the point that a rig that had a build in AC power supply always had better sensistivity, dynamic range, etc. than a radio that required a 12- 15 volt external power supply.

Is there any basis to that? He seem to be making a fairly convincing argument, although, I thought both rigs require 13-15 vold dc, whether it comes from an internal ac supply that converts it to 13-15 dc, or simply

a rig that takes the dc direct.

I think they were serious top gunners, talking about top of the line
world class radios.

I would apprecaite hearing any technical comments about this.

Thanks and 73's.

>but channels that hold UHF freqs are ok and are not resetted ????
>
>Does anyone know why ?
>
>Is there two backup batteries, one for each band ? (I guess, no.)
>
>I do not have scema just now so I can't hunt that error myself.
>
>Any ideas ????
>
> de Pasi
My IC-28A and R2000(Kenwood SW) both had the same symptons as you
describe. The internal Lithuim back up 3v batery (Br2026???) went
south. You can likeky get these bateries at Radio Shack.
My R2000 wnet thru Litiums cells about every 6mths. I used one of
those large "C" backup cells(about 1F at 5v) in both the IC-28A and
the R2000. I forget what value of resitor I used to charge the "C".
My IC-28A will go at least 2Mths without lossing its mem.

Subject: Kenwood uses false advertising?

Lord GAD <73110.250@CompuServe.COM> sed:

:>>>These is no law that requires you to hold an Amateur license for
:>>> purchasing an Amateur radio transceiver.

:>AHA! I think there should be. If you must be lisensed to xmit, why
:>not be lisensed to buy? I realize that my own situation would
:>change as my fiance bought me my first rig, but hey, compromise is
:>key.

Your eminence, Lord GAD:

[Here we go again with this thread] ;-D

Have you thought about the ramifications that would exist if what you stated
came to be? Nearly every ham who holds a Novice thru Advanced class ticket
would not be able to purchase an HF rig that covered the entire amateur HF
spectrum. Since they are not licensed to transmit in the next higher class' of
license subband they [according to your statement] should not be able to
purchase such a rig.

And a Novice operator would not be able to buy a two meter radio.

Think about it. It's not up to us [as hams] to determine who can and cannot
own or purchase a radio. After purchase it is between the buyer and the FCC if
the radio gets used. Unless of course you are appointing yourself an operation
police person. Then YOU can run around and check to make sure that stores are
selling xmitting equip only to licensed individuals.

From: towen@freenet.vcu.edu
Subject: Transverter Info

In reference to the 2m SSB transverter you are considering, my experience is the following:
I bought a 2m Allmode Yeasu FT-290MarkII (25W) output for $425 recently. I considered a cheap 10M allmode + transverter, but for the money, size and convienence of a single rig I chose the FT-290 (I did not already have a HF rig).

My point is that you can get used FT-290 with the same specs as the transverter for about the same price.

From: wright@onramp.net (jeff wright)
Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of
those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

From: swdecato@nps.navy.mil
Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are the operating frequencies changed? What are the input voltages for proper battery connection. I'm just wondering if I could get the thing to work on 2 meters.

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of

one of my local ham friends. I'd be interested in knowing the best rtty and sstv interface to get us up and running in time for the CQWW RTTY DX contest later this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we could qrv on sstv using the sound card...is it true? Otherwise, looking at the PASOKON SSTV card (73 Mag last month) and have no idea what rtty controller to buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes, Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

Hi Tom, I too have tried several computer logging programs. I assume you are interested in the casual day-to-day logging, not contest logging. For casual daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I believe
version 2.24 was a "testware" program that allowed free testing for a period of time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before, date, time, band, etc. Shows QSO's with that country before. Automatically tally's DXCC and WAS by band, by mode. Has default settings for power-up (I enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option allows me to store long/lat data of my qth and shows the lp and sp and distance to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says "less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I still am using the HYPERLOG software. No, I have no affiliation with Hyperlog in any way. A friend in JA introduced me to the software after trying something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

> not result in any further increase in RF output.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out,

at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>I'd be interested in finding out whether other HTs have

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

>

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: Need Ten Tec SCOUT555 info

Does anybody have or know about SCOUT-555 inexpensive mono band transceiver from Ten Tec? Please let me ask you a couple of questions.

1.What sort of circuit is in a band module? The band module is the one you have to pull out and push another one into the transceiver to change the band.

2.Would it be possible to build the band module by yourself?

Thanks in advance,

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the limited output power - even with an external antenna on a car I have difficulty getting reliable QSOs thru repeaters. I am looking at buying a "brick" amplifier to get round this. The other restriction is the audio output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on climbing trips and use in hotel rooms when travelling. Sure there is no autopatch capability, but look at the size and price! The scanning capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and

the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220
repeater and my 2m HT, I have to wait for the 220 repeater to drop
before I can transmit. This becomes a real drag when on a roundtable
on the 220 repeater and it has a long hang time. Is there anyway
around this? Is there a way to make the 742A act like a single
frequency repeater on the 2m side (ie. sample the receive every few
hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

From: Bill <Bill@survival.demon.co.uk>
Subject: Regulations Shortwave Transmitter/Receiver must fullfill (help)

A UK based charity has developed a pedal powered generator to operate a short-wave transmitter/receiver working at (4.005 MHz). The use is to supply village to village communication in Tanzania Africa. A small pilot project has successfully run for the last 12
years with commercial bought in equipment. The aim is to manufacture pedal generators and short-wave transmitter/receivers locally in Tanzania both to save foreign currency and provide
local employment.

A transmitter/receiver has been designed and 95 per cent completed.

Does anyone know what international regulations such a short-wave transmitter/receivers would have to comply with? The project is based in the UK.

Thank you for any help anyone can give.

Butch, It shouldn't be that hard to put in an aftermarket tone board. The factory board will only let you set it up for three different frequencies, if I remember correctly. If you only need one frequency, I would look at one of the miniature tone boards that Communications Specialists sell. They are available from a lot of the mail order places. They are very simple to hook up. The original factory tone board plugged into a small plug on the 7950. My guess it was a B+, GND and tone into the radio line. Even if it is not, you can call Communications Spealists and they will tell you where to connect their boards on most radios. I hope this helps....73's Floyd WD5ENJ

> I would appreciate your comments on the Radio Shack 2m Handheld
> transceiver.
> I'm a rank beginner with my new tech licence, looking for my
> first rig.

Not to send you off the track of a HTX-202, but I've just heard about
the 4th radio in my county going on the blink. Intermittent transmit.

All the same problem. The latest one is 3 months old. Whenever used on 12 V. it is on a mobile 5/8 antenna.

True, I don't know how many operators in my county have the HTX-202, exactly. There are approximately 1300 or so amateurs that live in my county. I'm sure they don't all own the HTX-202. ;-)

The ones that do work sound good. The owners like them. Just about every owner that I have talked to has the extended warranty. (And it is apparently pretty good tha they do have it...)

> Is it a good buy for $260? I notice that they bundle in a few
> options in the
> price, that others don't. Is there a better choice in that
> price range?

Considering the problems that I've heard with this HT, >if it were me<, I wouldn't purchase it without the extended warranty. Figure another $40 or whatever it costs onto the price of your HT. Now you're looking at around $300. Is it worth that much? In my opinion, no.

Now if you get it for the sale price of around $190 + $40 warranty, you're looking at $230ish. Yeah, maybe it is worth that to someone. Did I say "Don't buy this radio without the warranty?" Well, if I didn't say it, be sure you don't buy it without the warranty.

Actually, I think Radio Shack ought to adjust the price of their radio so it includes the price of the 5 year warranty. Of course, others may not think that way... I'm just going by the track record I've seen from locals on this radio...

I must add that Radio Shack has been very good to the locals in the customer service department. They stand behind their product. That is an important consideration when considering a purchase of most anything.

It is reported that the HTX-202 is very good in a high RF environment. It tends to not suffer from intermod interference. This might be something to consider, too.

All in all, I'm pretty neutral on the HTX-202. I probably wouldn't buy one for myself, but I'm not in the market for a 2M HT, either.

Contratulations on your new license and enjoy--

73,
Ken

From: wright@onramp.net (jeff wright)
Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of
those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

Regards,

jeff wright

Subject: Need MOD for ICOM T21AT

Hello All;
I just got an ICOM T21AT 2M HT through a trade. The extended RX was done
by the keypad. How about the TX? Does anyone know of the TX mod for this
HT? BTW What is the full freqs coverage for this thing?

From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper

battery connection. I'm just wondering if I could get the thing to work on
2 meters.

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later

this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed

the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

Hi Tom, I too have tried several computer logging programs. I assume you are interested in the casual day-to-day logging, not contest logging. For casual daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I believe
version 2.24 was a "testware" program that allowed free testing for a period of time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before, date, time, band, etc. Shows QSO's with that country before. Automatically tally's DXCC and WAS by band, by mode. Has default settings for power-up (I enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option allows me to store long/lat data of my qth and shows the lp and sp and distance to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says "less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I still am using the HYPERLOG software. No, I have no affiliation with Hyperlog in any way. A friend in JA introduced me to the software after trying something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

> a rather linear rise from 2.25 watts @ 7.2 volts to 5 watts @ 10.4
> volts. Increasing the supply voltage beyond about 10.4 volts did
> not result in any further increase in RF output.

This is because the radio has a feedback circuit which measures the power
output (actually it often measures the RF voltage output), and adjusts the

RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> - DC CURRENT DRAIN AT EACH POWER SETTING WAS LARGELY INDEPENDENT
> OF SUPPLY VOLTAGE. On low power transmit, the current drain was
> 0.5 A regardless of supply voltage. On medium power transmit,
> the current drain was 0.8 A regardless of supply voltage. On
> high power transmit, the current drain increased from 1.1 A
> @ 7.2 VDC (2.25 W RF output) to 1.6 A @ 10.4 VDC (5 W RF output).
> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>I'd be interested in finding out whether other HTs have

>some, go with the 6 amp variety. They will get VERY hot in actual use,
>and you'll have an extra degree of robustness with these. Just make sure
>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only
from California...

The last U-Haul I rented had binding posts on the dash with 12VDC
available. I suppose we could tell each other that they did it for the
Ham community, but my real guess is that they got tired of people
butchering the wiring to hook up CB's. I know from several years of
experience in repairing over-the-road trucks that some people will cut
into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the limited output power - even with an external antenna on a car I have difficulty getting reliable QSOs thru repeaters. I am looking at buying a "brick" amplifier to get round this. The other restriction is the audio output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on climbing trips and use in hotel rooms when travelling. Sure there is no autopatch capability, but look at the size and price! The scanning capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220
repeater and my 2m HT, I have to wait for the 220 repeater to drop
before I can transmit. This becomes a real drag when on a roundtable
on the 220 repeater and it has a long hang time. Is there anyway
around this? Is there a way to make the 742A act like a single
frequency repeater on the 2m side (ie. sample the receive every few
hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

From: Bill <Bill@survival.demon.co.uk>
Subject: Regulations Shortwave Transmitter/Receiver must fullfill (help)

A UK based charity has developed a pedal powered generator to operate a short-wave transmitter/receiver working at (4.005 MHz). The use is to supply village to village communication in Tanzania Africa. A small pilot project has successfully run for the last 12
years with commercial bought in equipment. The aim is to manufacture pedal generators and short-wave transmitter/receivers locally in Tanzania both to save foreign currency and provide
local employment.

A transmitter/receiver has been designed and 95 per cent completed.

Does anyone know what international regulations such a short-wave transmitter/receivers would have to comply with? The project is based in the UK.

Thank you for any help anyone can give.

Bill

Butch, It shouldn't be that hard to put in an aftermarket tone board. The factory board will only let you set it up for three different frequencies, if I remember correctly. If you only need one frequency, I would look at one of the miniature tone boards that Communications Specialists sell. They are available from a lot of the mail order places. They are very simple to hook up. The original factory tone board plugged into a small plug on the 7950. My guess it was a B+, GND and tone into the radio line. Even if it is not, you can call Communications Spealists and they will tell you where to connect their boards on most radios. I hope this helps....73's Floyd WD5ENJ

I believe that there are many CB repeaters in Australia. There is a UHF CB band there and it is (or was) well used. Perhaps one of our VK readers could enlarge on this?

As for 27MHz-no, as far as I know (legally) although I did know someone who had actually built one for 27MHz. It did work but I believe the authorities caught up with him for various infringements of Wireless Telegraphy Acts and it went no further.

Of course there are many 29 MHz FM repeaters about in various countries and these work very well, so it wouldn't be a problem to build one for CB.

But why bother?.....!

Why? Just more government regulation in our life. There
may be no law that says they cannot sell Amateur equipment
to anyone, but there is no law that says you HAVE to sell
anyone Amateur equipment. Likewise there is no law that
prevents the seller from having a policy of NOT selling
to anyone without the proper license.

From: td_eecs@ix.netcom.com (Tom Daggett)
Subject: Ham Logginf Software

Does anyone know a GOOD loggin program for ham radio. I know there are
some out there, but I'm having bad luck getting one. I recently bought
a CD-ROM that had no less than 15 logging programs -- none of them
worked! I'm not too anxious to part with green money again until I
know what I'm getting in advance!

Does anyone have one that they are really in love with? If so, why the
love affair!

Thanks,

Tom

Subject: HF tranciever vs reciever's for audio quality

Iam new to Ham radio having just passed my no-code licence, and have already begun learning the code. What got me interested in Ham was listening to the Major shorwave broadcasts BBC etc. At one time I fashioned buying a top of the line communications reciever DrakeR8, Kenwood 5000 or Japan radio all of which are known for there good audio quality as well as there dx ability. Now that Iam making my way into ham radio Ive noticied that for example some of the kenwood transcievers are priced not to much higher than the top of the line coommmunications recievers. Ill always want to continue listening to the major SW broadcasters. I like the what i think is the more balanced news perspective of the bbc. Currently I have a grundig sat 700 reciever. Are the audio quality most importantly listenability good on the mid priced trancievers in comparison to the high end recievers? Will I miss Synch detection commonly used on communications recievers? Are some trancievers esp known for there audio quality-dynamic range? Thanks, iam betting there is some hams who also listen to the majors and have been thru this dillema. Bill Hansen

From: wright@onramp.net (jeff wright)
Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of
those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

Our local Radio Shack stores stock only HF SWR meters,

HOWEVER

They were able to order an inline SWR/POWER meter for 2m/70cm. This is
not in our stores but is still available.

Details:
Part number = 10508018
Price = $46.19 which is cost+postage+tax
Time for home delivery = 7 to 10 working days.

From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

From: swdecato@nps.navy.mil
Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper
battery connection. I'm just wondering if I could get the thing to work on
2 meters.

From: travisp@ix.netcom.com (Gerald Phillips)
Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically
tally's DXCC and WAS by band, by mode. Has default settings for power-up (I
enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option
allows me to store long/lat data of my qth and shows the lp and sp and distance
to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says
"less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I
still am using the HYPERLOG software. No, I have no affiliation with Hyperlog
in any way. A friend in JA introduced me to the software after trying

something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to

show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>I'd be interested in finding out whether other HTs have

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the
limited output power - even with an external antenna on a car I have
difficulty getting reliable QSOs thru repeaters. I am looking at buying a
"brick" amplifier to get round this. The other restriction is the audio
output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on
climbing trips and use in hotel rooms when travelling. Sure there is no
autopatch capability, but look at the size and price! The scanning
capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

From: rick.edwards@mogur.com (Rick Edwards)
Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220 repeater and my 2m HT, I have to wait for the 220 repeater to drop before I can transmit. This becomes a real drag when on a roundtable on the 220 repeater and it has a long hang time. Is there anyway around this? Is there a way to make the 742A act like a single frequency repeater on the 2m side (ie. sample the receive every few hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

Subject: Out of band RX on FT-51R

A few days ago I posted a way to extend the RX on the FT-51R. I didn't try it until yesterday and I couldn't seem to get it to work. I know there are a few people out there that got it to work, do you think you can help me? I changed the line to 1 after I loaded in a template, then downloaded the same file to the radio, but it still doesn't seem to want to accept out of band RX freqs.

Any help will be appreciated.

Subject: Sub-audible tone generator

I have a Kenwood tr-7950 that does not have the optional tu-79 tone unit installed. Kenwood says that option is no longer available. does any one know of a way to build one? The local repeaters are all using 100Hz tones, so thats the only one I will need.
Any info about how to make one or how to modify another unit to work in the 7950 would be appreciated.

Thanks,

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

From: Bill <Bill@survival.demon.co.uk>
Subject: Regulations Shortwave Transmitter/Receiver must fullfill (help)

A UK based charity has developed a pedal powered generator to operate a short-wave
transmitter/receiver working at (4.005 MHz). The use is to supply village to village
communication in Tanzania Africa. A small pilot project has successfully run for the last
12
years with commercial bought in equipment. The aim is to manufacture pedal generators and
short-wave transmitter/receivers locally in Tanzania both to save foreign currency and
provide
local employment.

A transmitter/receiver has been designed and 95 per cent completed.

Does anyone know what international regulations such a short-wave transmitter/receivers
would have to comply with? The project is based in the UK.

Thank you for any help anyone can give.

Bill

Butch, It shouldn't be that hard to put in an aftermarket tone board.
The factory board will only let you set it up for three different
frequencies, if I remember correctly. If you only need one frequency,
I would look at one of the miniature tone boards that Communications
Specialists sell. They are available from a lot of the mail order
places. They are very simple to hook up. The original factory tone
board plugged into a small plug on the 7950. My guess it was a B+,
GND and tone into the radio line. Even if it is not, you can call
Communications Spealists and they will tell you where to connect their
boards on most radios. I hope this helps....73's Floyd WD5ENJ

Not to send you off the track of a HTX-202, but I've just heard about the 4th radio in my county going on the blink. Intermittent transmit. All the same problem. The latest one is 3 months old. Whenever used on 12 V. it is on a mobile 5/8 antenna.

True, I don't know how many operators in my county have the HTX-202, exactly. There are approximately 1300 or so amateurs that live in my county. I'm sure they don't all own the HTX-202. ;-)

The ones that do work sound good. The owners like them. Just about every owner that I have talked to has the extended warranty. (And it is apparently pretty good tha they do have it...)

> Is it a good buy for $260? I notice that they bundle in a few
> options in the
> price, that others don't. Is there a better choice in that
> price range?

Considering the problems that I've heard with this HT, >if it were me<, I wouldn't purchase it without the extended warranty. Figure another $40 or whatever it costs onto the price of your HT. Now you're looking at around $300. Is it worth that much? In my opinion, no.

Now if you get it for the sale price of around $190 + $40 warranty, you're looking at $230ish. Yeah, maybe it is worth that to someone. Did I say "Don't buy this radio without the warranty?" Well, if I didn't say it, be sure you don't buy it without the warranty.

Actually, I think Radio Shack ought to adjust the price of their radio
so it includes the price of the 5 year warranty. Of course, others may
not think that way... I'm just going by the track record I've seen from
locals on this radio...

I must add that Radio Shack has been very good to the locals in the
customer service department. They stand behind their product. That is
an important consideration when considering a purchase of most anything.

It is reported that the HTX-202 is very good in a high RF environment. It
tends to not suffer from intermod interference. This might be something
to consider, too.

All in all, I'm pretty neutral on the HTX-202. I probably wouldn't buy
one for myself, but I'm not in the market for a 2M HT, either.

Contratulations on your new license and enjoy--

73,
Ken

You need to arrage a -600kHz shift on TX for 2M and a +1.6MHz shift TX
on transmit. Next, you need a 1750Hz toneburst or practice your
whistling! (For disbelievers it *is* possible to open most repeaters by
whistling - one VK thought I was winding him up.....)

And don't forget we use 25kHz channel spacing and the band limits are
144-146 and 430-440MHz!

Yes there were CB repeaters. I used to sell them. They were
licensed as Class A and operated in the UHF band.

I'm not up on the current regulations for this but understand that
some REACT groups are using something similar on GMRS.

You will probably have some lengthy license applications to complete
if this is still allowed.

Hope this helps,

You may be correct in this, but it shouldn't be this way. I don't
think ham stores should refuse to sell to non-licensed people, but I
also don't think they should be forced to do so against their wishes.
A basic rule of contract law (which includes sales) is that both
parties enter the transaction willingly, so if the seller doesn't want
to sell to the prospective buyer, no sale.

Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of
those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

The 733 is a fine radio, easy to use, never gets hot, and very stable !!
The only minus is the small number of memories available and the somewhat
strange place the packet modem jack is found (front panel)...
In my opinion the 733 is a good choice for a mobile dual bander...

To use the feature you must be in dual band mode (both VHF and UHF
active). Then it works for me.

BTW has anyone had trouble with the rubber knob coming off its insert?
Mine just rubbed off. I hope its not like the 530 knob.

>comparison to any other HF radios in the same price range.

I have owned many rigs in the last 5 years. I just love playing with the
new knobs I guess. Which rig's well lets see: TS-830S, TS-850S/AT,
TS-940S/AT (QTY 2), FT-1000D, FT-900/AT, FT-890/AT, IC-725, IC-735, and
several Hand Helds and mobile VHF/UHF rigs.

The best NEW rig that can be had for $1500, IMHO is the FT-900/AT, but
if you do not mind buying used, buy the FT-890/AT. That rig is great!
Small box, great receiver and noise blanker. All the features of the
TS-850/AT except for the memories. That I would say is the only negative
aspect of the FT-890. The FT-900 is a great radio also, but I really
feel that the 890 is a better rig over all, and if you don't plan on
using it as a PERMANENT mobile rig, than the 890 WINS!

Now the Kenwood TS-850 is a fin radio and don't get me wrong on this, I
do not mean to cut it short, but the FT-900 and 890 will out perform the
Kenwood on a side by side test. I have done it and I am convinced.

What is one of my all time favoite's, The Kenwood TS-940S/AT with a few
mod's applied. Like the Geihl firmware update, and the IRCI 2.1Khz SSB
filters. That rig is great once you fix up the cooling fans in it. They
tend to break down and get noisy after about one year of operation. Best
fix I have heard of is to replace them with PC type 12 Volt muffin's.
Although I have not personally done this, it sounds like a good Idea.

I am using the FT-1000D at the home station now, and it is really the
greatest radio I have ever owned, but good God it is expensive.

73 and I hope this helps.

Brian,

I've had personal experience with an R-5 and an R-7 at my previous residence, and a Mosley TA-33 jr. (4-element 5-band) yagi and then a KLM KT-34 (4 element triband) beam, with inverted Vees for 40 and 80 meters at my current location. Of course the beams outperformed the R-5 and R-7 on 10-20 meters as you would expect, but the R-7 is better overall on 40 meters than my inverted Vee setup. Another advantage about the R-5/R-7 is that you don't need to get them very high off the ground to perform well. 10 ft. off the ground and free of any close obstacles is fine.

The only drawback I can see about the R-7 as compared to the R-5 is that it is not as broad-banded on 20 meters. (The R-5 is almost flat throughout 20 meters).

I think you pretty much can't go wrong with either the R-5 or the R-7. They're both It's a good overall antennas, and the R-7 is especially on 40 meters.

Feel free to contact me via e-mail if you wish to discuss it any further.

From: gkd@wpi.WPI.EDU (Gregory K Doerschler)
Subject: HT too HOT to handle?

This article summarizes some observations I made concerning the heat generated by my Alinco DJ-580 dual band HT when powering if from an external 13.8 VDC supply. These may be of interest to those who find their HTs getting excessively hot when running them from external supplies. I don't know the extent to which my findings are applicable to other brands and models.

The Alinco DJ-580 has a power jack on the side of the radio designed to accept 13.8 VDC directly. I'd often use an external 13.8 VDC supply when using the HT at a fixed location, but found that the radio quickly gets too hot to handle when doing any serious transmitting. The conventional wisdom is that this occurs because the radio is putting out 5 watts when being powered by 13.8 VDC, as opposed to approx. 2.25 watts when using the standard 7.2 volt battery pack. However, even when transmitting at the medium power setting (which is 1.2 watts regardless of supply voltage), the radio was getting objectionably hot when using the 13.8 VDC supply; but not when running it off the 7.2 VDC battery pack. Analyzing supply voltage, power output, and DC current drain measurements revealed the following (for 2 meters):

- Low power transmit was 0.25 watts, regardless of supply voltage.

- Medium power transmit was 1.2 watts, regardless of supply voltage.

- High power transmit was dependent upon supply voltage. It showed a rather linear rise from 2.25 watts @ 7.2 volts to 5 watts @ 10.4 volts. Increasing the supply voltage beyond about 10.4 volts did not result in any further increase in RF output.

- DC CURRENT DRAIN AT EACH POWER SETTING WAS LARGELY INDEPENDENT OF SUPPLY VOLTAGE. On low power transmit, the current drain was 0.5 A regardless of supply voltage. On medium power transmit, the current drain was 0.8 A regardless of supply voltage. On high power transmit, the current drain increased from 1.1 A @ 7.2 VDC (2.25 W RF output) to 1.6 A @ 10.4 VDC (5 W RF output). BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.

The implications of this final observation should be obvious. At 10.4 VDC, the radio is consuming 16.6 watts of input power to produce 5 watts RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to produce the same 5 watts RF output. This means that an extra 5.5 watts of power is being used when the supply voltage is increased from 10.4 VDC to 13.8 VDC. Since RF output power remains constant, that extra power is being dissipated primarily as heat.

Consider the medium RF power setting (1.2 W output @ 1.1 A DC current drain, regardless of input voltage). At 7.2 VDC supply voltage, the radio is using 7.9 watts input power. At 13.8 VDC, it is using 15.2 watts input power. That's an extra 7.3 watts of power being dissipated primarily as heat when using the 13.8 VDC supply. No wonder the radio gets hotter!

Measurements with UHF transmit paralleled the VHF findings, although current drains were a tad higher and maximum RF power output was reached at about 11 VDC supply voltage, rather than 10.4 VDC.

These finding suggest that if the DJ-580 were powered by an external source of 10.4 - 11 VDC rather than 13.8 VDC, less heat would be generated without any tradeoff in RF output. My tests confirmed this. The radio still got warm with heavy use when powered by 10.4 VDC, but only became objectionably hot after a slew of long winded transmissions at 5 watts RF output (with a transmit duty cycle well in excess of 50%). Further heat reduction would be expected if the external supply voltage were dropped even more; but there would be a tradeoff in high power RF output.

I'd be interested in finding out whether other HTs have voltage/current/RF-output relationships similar to the DJ-580. If so, hams having trouble with excessively hot HTs when powered from external DC supplies might be able to alleviate the problem by determining the voltage at which high RF power output begins to drop off, and using that voltage level to supply the radio (rather than the full 13.8 volts). I installed 4 or 5 rectifier diodes in series with my (+) DC power lead as a quick and dirty method of reducing the voltage supplied to the radio. Each rectifier diode should have a voltage drop somewhere between 0.6 and 0.9 volts, depending on the device and current drain. If you do this, I'd suggest using diodes with a rating of at least 3 amps. If you need to buy some, go with the 6 amp variety. They will get VERY hot in actual use, and you'll have an extra degree of robustness with these. Just make sure you put them in a place where the heat won't cause problems.

Man, does that sound familiar. Besides myself, I know 3 other guys who bought kenwood ts440s's (late models), and EVERY friggen one of crapped out the same way. I fixed mine once, and then had kenwood fix it. Sam damn thing. One would think that all radio manufactures would know how to make a pll by now. Guess not.

>
>On the other hand, NOTHING I've ever owned didn't at one time or another
>need fixin. Ask me about the ICOM W2A...

True enough. I just wish my jap radio equipment was HALF as reliable as my wife's Kenmore washing machine. After the adventures with my '440, I have decided to make that my first, and last Kenwood. The next biggest piece of crap I own is an Icom 04/at. Yet even more PLL problems. I can promise this, the next hf radio I buy will in all likelyhood be a TEN-TEC.

BTW, Our little group of ham guys gets together almost every Saturday night, and we have a long-standing joke that refers to the one of the guys "DEAD RADIO COUCH" down in his basement /radio room. Pretty funny stuff. That sucker was loaded about 2.5' high last year with a wide variety of broken Kenwoods and Icoms. Ahhh, guess you had to be there.

Subject: Kenwood TM 255E

Hello,

I've got an all mode 2 meters transceiver Kenwood TM 255E.
It has a very efficient reception.
But sometimes the output power decreases suddenly (to only the half nominal power), where as the VSWR of the antenna does not exceed 1.2 (it happens even on a dummy load !!) and moreover the linear amplifier is not really hot. So I suppose that there's a problem with the thermal protection or the SWR protection but i'm not sure.
If someone else has the same problem and may be has found the solution :

AHA! I think there should be. If you must be lisensed to xmit, why not be lisensed to buy? I realize that my own situation would change as my fiance bought me my first rig, but hey, compromise is key.

In SCUBA, you can buy all the equipment you want, but you cannot buy compressed air or an air tank without a "C" card. perhaps we need the same enforcement in HAM.

Gosh David, what a personal attack. Hey I don't bash all the RS stuff,
just the junk. Their resistors are great. Never yet had one fail.

On a serious note, since you think I am so negative on everybody, the
ham manufacturers that I think are great and produce quality products:
Ten-Tec, Index Labs, Yaesu, Icom, Astron, and Timewave. O.K. but not
great are Kenwood and MFJ. All my opnions and related to experience.

I won't comment on the RS stuff. They are off the chart in a negative
direction.

Got your license?

The best thing you can do is join your local Amateur Radio club. There
you will learn what is happening in your area.

Take "everyone's" advice and buy "such-and-such" units --- and you may
wind up with something totally unuseable for your area and situation.

By joining your local club, you will also be "subjected" to a lot of
personal assistance and recommendations - FAR more valuable than what we
can tell you here!

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically

tally's DXCC and WAS by band, by mode. Has default settings for power-up (I enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option allows me to store long/lat data of my qth and shows the lp and sp and distance to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says "less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I still am using the HYPERLOG software. No, I have no affiliation with Hyperlog in any way. A friend in JA introduced me to the software after trying something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the limited output power - even with an external antenna on a car I have difficulty getting reliable QSOs thru repeaters. I am looking at buying a "brick" amplifier to get round this. The other restriction is the audio output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on climbing trips and use in hotel rooms when travelling. Sure there is no autopatch capability, but look at the size and price! The scanning capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220 repeater and my 2m HT, I have to wait for the 220 repeater to drop before I can transmit. This becomes a real drag when on a roundtable on the 220 repeater and it has a long hang time. Is there anyway around this? Is there a way to make the 742A act like a single frequency repeater on the 2m side (ie. sample the receive every few hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

Alan, WA6AQC

From: wright@onramp.net (jeff wright)
Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of
those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

Subject: Radio Shack 2 meter SWR meter

Our local Radio Shack stores stock only HF SWR meters,

HOWEVER

They were able to order an inline SWR/POWER meter for 2m/70cm. This is
not in our stores but is still available.

Details:
Part number = 10508018
Price = $46.19 which is cost+postage+tax
Time for home delivery = 7 to 10 working days.

Date: 29 Aug 1995 20:58:04 GMT
From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

From: swdecato@nps.navy.mil
Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper
battery connection. I'm just wondering if I could get the thing to work on
2 meters.

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

I have a 733 and I'm very happy with it. I have a dual band handheld
and I use the cross band repeater function in the 733 often. I have
it mounted in a manner similar to yours and that's why I purchased
it.

I wouldn't register Hyperlog anytime soon. Apparently Hyperlog Pro
will be out soon and I don't know that registered users of Hyperlog
will get any break on the new version.

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically
tally's DXCC and WAS by band, by mode. Has default settings for power-up (I
enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option
allows me to store long/lat data of my qth and shows the lp and sp and distance
to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says
"less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I
still am using the HYPERLOG software. No, I have no affiliation with Hyperlog
in any way. A friend in JA introduced me to the software after trying

something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to

show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the
limited output power - even with an external antenna on a car I have
difficulty getting reliable QSOs thru repeaters. I am looking at buying a
"brick" amplifier to get round this. The other restriction is the audio
output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on
climbing trips and use in hotel rooms when travelling. Sure there is no
autopatch capability, but look at the size and price! The scanning
capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

From: rick.edwards@mogur.com (Rick Edwards)
Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220 repeater and my 2m HT, I have to wait for the 220 repeater to drop before I can transmit. This becomes a real drag when on a roundtable on the 220 repeater and it has a long hang time. Is there anyway around this? Is there a way to make the 742A act like a single frequency repeater on the 2m side (ie. sample the receive every few hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

I have had my TM-742A with a six-meter module for almost two
years. The unit is used daily as a mobile rig. Absolutely
zero problems so far.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

From: Bill <Bill@survival.demon.co.uk>
Subject: Regulations Shortwave Transmitter/Receiver must fullfill (help)

A UK based charity has developed a pedal powered generator to operate a short-wave
transmitter/receiver working at (4.005 MHz). The use is to supply village to village
communication in Tanzania Africa. A small pilot project has successfully run for the last
12
years with commercial bought in equipment. The aim is to manufacture pedal generators and
short-wave transmitter/receivers locally in Tanzania both to save foreign currency and
provide
local employment.

A transmitter/receiver has been designed and 95 per cent completed.

Does anyone know what international regulations such a short-wave transmitter/receivers
would have to comply with? The project is based in the UK.

Thank you for any help anyone can give.

Bill

>Thanks,

>Butch KF5DE

Butch, It shouldn't be that hard to put in an aftermarket tone board.
The factory board will only let you set it up for three different
frequencies, if I remember correctly. If you only need one frequency,
I would look at one of the miniature tone boards that Communications
Specialists sell. They are available from a lot of the mail order
places. They are very simple to hook up. The original factory tone
board plugged into a small plug on the 7950. My guess it was a B+,
GND and tone into the radio line. Even if it is not, you can call
Communications Spealists and they will tell you where to connect their
boards on most radios. I hope this helps....73's Floyd WD5ENJ

Subject: Yaesu FT-530 replacement antenna

I also have a FT-530 and replaced the stock antenna with a Diamond RH77CA
rubber duck. It is about 14.5" inches long from the base.
It is far superior than the stock antenna. I paid $35 for it at the local
Ham Radio Outlet store. I've seen these at hamfests for around $20.

From: wright@onramp.net (jeff wright)
Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of
those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

From: swdecato@nps.navy.mil
Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper
battery connection. I'm just wondering if I could get the thing to work on
2 meters.

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically
tally's DXCC and WAS by band, by mode. Has default settings for power-up (I
enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option
allows me to store long/lat data of my qth and shows the lp and sp and distance
to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says
"less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I
still am using the HYPERLOG software. No, I have no affiliation with Hyperlog
in any way. A friend in JA introduced me to the software after trying

something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

> not result in any further increase in RF output.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to

show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>I'd be interested in finding out whether other HTs have

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: Need Ten Tec SCOUT555 info

Does anybody have or know about SCOUT-555 inexpensive mono
band transceiver from Ten Tec? Please let me ask you a couple
of questions.

1.What sort of circuit is in a band module? The band module
is the one you have to pull out and push another one into the
transceiver to change the band.

2.Would it be possible to build the band module by yourself?

Thanks in advance,

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the
limited output power - even with an external antenna on a car I have
difficulty getting reliable QSOs thru repeaters. I am looking at buying a
"brick" amplifier to get round this. The other restriction is the audio
output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on
climbing trips and use in hotel rooms when travelling. Sure there is no
autopatch capability, but look at the size and price! The scanning
capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220 repeater and my 2m HT, I have to wait for the 220 repeater to drop before I can transmit. This becomes a real drag when on a roundtable on the 220 repeater and it has a long hang time. Is there anyway around this? Is there a way to make the 742A act like a single frequency repeater on the 2m side (ie. sample the receive every few hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

From: Bill <Bill@survival.demon.co.uk>
Subject: Regulations Shortwave Transmitter/Receiver must fullfill (help)

A UK based charity has developed a pedal powered generator to operate a short-wave
transmitter/receiver working at (4.005 MHz). The use is to supply village to village
communication in Tanzania Africa. A small pilot project has successfully run for the last
12
years with commercial bought in equipment. The aim is to manufacture pedal generators and
short-wave transmitter/receivers locally in Tanzania both to save foreign currency and
provide
local employment.

A transmitter/receiver has been designed and 95 per cent completed.

Does anyone know what international regulations such a short-wave transmitter/receivers
would have to comply with? The project is based in the UK.

Thank you for any help anyone can give.

Bill

Butch, It shouldn't be that hard to put in an aftermarket tone board.
The factory board will only let you set it up for three different
frequencies, if I remember correctly. If you only need one frequency,
I would look at one of the miniature tone boards that Communications
Specialists sell. They are available from a lot of the mail order
places. They are very simple to hook up. The original factory tone
board plugged into a small plug on the 7950. My guess it was a B+,
GND and tone into the radio line. Even if it is not, you can call
Communications Spealists and they will tell you where to connect their
boards on most radios. I hope this helps....73's Floyd WD5ENJ

From: wright@onramp.net (jeff wright)
Subject: Out of band RX on FT-51R

I was curious, so I called both Yaesu tech support and RT Systems (the
makers of the programming software).

Yaesu said it wasn't a "recommended mod", but that the software freq
change using the programmer shouldn't hurt the radio.

When I called RT Systems, the gentleman I spoke with said the radio was
only capable of receiving from 100-180 and 375-525 MHZ. Anything out of
those freqs would not be heard at all...

Reply direct if you have any luck with this, I am still testing it out myself.

From: Allan Spitzer <aspitzer@ccmail.gsfc.nasa.gov>
Subject: Background noise using HTX-202 mobile

During recent qso's from my car, I have been told that I have a lot of
background noise. The noise sounds like I have the windows open even
though I do not. The noise disappears when I stop the car, even if the
engine is still on. I am using an HTX-202 with a 5/8ths wave mag-mount.

I was thinking about trying an external mic, but I have a sneaking
suspicion that the noise is engine related (the car is new Civic).

Any suggestions would be appreciated.

Thanks,

Allan N3TCM

Subject: Found Radio in Road

My wife was driving down the road the other day and spotted a little
black box in the middle of the road. She stopped to investigate and it
turned out to be GE Radio (transciever).

On the back it says ERICSSON GE Model PAJ02. The battery pack was
missing and it was pretty scratched and dented by being run over by cars.
On the bottom there are several power connections where the battery was.
I experimented until I got the digital display to light up when connected to
a little 9v battery. I was also able to get audio out of it so it appears to
be working. I suspect it is a public service type radio.

My question is... Does anyone know what type of radio this is? How are
the operating frequencies changed? What are the input voltages for proper
battery connection. I'm just wondering if I could get the thing to work on
2 meters.

I was just making "guesses and assumptions" as my first suspicions.
What you suspect has been suggested to me in several Email messages I
received from other members of the group. I have gotten some good leads
to look into. I plan to check it out as soon as I get some time.

To everyone, I appreciate all the help and suggestions that were made.

Subject: DJ580T mod question

I am atempting to do the extended receive mod. on my DJ580T. I know
that you are supposed to cut the red wire, but I want to make sure
which wire you cut. With the unit's display facing up and the bottom
removed you can see a "red" loop wire that is about the same size as
the blue one, and then there is a small "orange/red" wire at the top.
I believe I cut the larger loop which is red and not the smaller loop
that is orange/red. If anyone can clear this up for me I would greatly
appreciate it. Thanks and 73.

Subject: Need Opinions: want to operate RTTY and SSTV

Hi folks. The only digital mode I've ever worked
before is CW. Now, I want to begin some RTTY and SSTV
operation from here in Taiwan with the assistance of
one of my local ham friends. I'd be interested in
knowing the best rtty and sstv interface to get us up
and running in time for the CQWW RTTY DX contest later
this year. We already have the following:

Rig,Amp,Antenna,486 PC, 8 bit sound card. Heard we
could qrv on sstv using the sound card...is it true?
Otherwise, looking at the PASOKON SSTV card (73 Mag
last month) and have no idea what rtty controller to
buy. Thinking about a MFJ-1270. Any suggestions?

P.S. Not interested in Packet or the other dig modes,
Just good old RTTY and some SSTV.

I've had good luck with a Kenwood TH-77. My suggestions:
- Used equipment in good shape is a better deal than buying new. Buy
locally if you can. Bring a friend along. Also scan the net to
get an idea on prices.
- Make sure it can receive on both bands at once. The TH-77 can send
audio from one band to a speaker-mike, with the other to the built-in
speaker. Some so-called dual-banders can only recieve on one band
at a time.
- Just remember it's an HT, not a mobile. They generally have intermod
problems when attached to a decent antenna.

I"m about six months ahead of you getting my technician and addressed
the same issue. After talking with older and greyer HAMS, I opted for
an ICOM W-31A. My rationale:

1) A lot of my traveling is at night so I wanted a lighted keypad. This
almost forced me to the ICOM line.

2) Memories: I travel a lot to a home in New Hampshire and a workplace
in Virginia. I've my ICOM programmed for both places, as well as home
base in Owego NY. I needed a lot of memory in order to do this. The
IC W-31A has fifty memories for each band.

3) I didn't want a detachable mike/keypad as it made the keypad smaller
and I"m "fat fingered".

4) Accessories: I also purchased the cigarette lighter adapter to give
me unlimited power supply (and 5 Watt transmit as well) and a "hot rod"
antenna to help ensure that I "get through" in emergencies.

Hi Tom, I too have tried several computer logging programs. I assume you are
interested in the casual day-to-day logging, not contest logging. For casual
daily QSO's, I've found HYPERLOG (TM) to be a superb logging program. I
believe
version 2.24 was a "testware" program that allowed free testing for a period of
time. If you like it, it can be purchased for 49.95 or something there abouts.

Features I enjoy: shows prior QSO's with a station that you've worked before,
date, time, band, etc. Shows QSO's with that country before. Automatically
tally's DXCC and WAS by band, by mode. Has default settings for power-up (I
enjoy 17 mtr CW, so it automatically comes up in that mode. Setup option
allows me to store long/lat data of my qth and shows the lp and sp and distance
to the country being worked. Print function is decent. Does QSL labels.

Though it's not totally free, it is worth 50-bucks (their advertisement says
"less than a hundred foot roll of RG-8 coax). Anyway, some 4000 QSO's later, I
still am using the HYPERLOG software. No, I have no affiliation with Hyperlog
in any way. A friend in JA introduced me to the software after trying

something called DXB (did not like it). Just a pleased customer.

I don't understand why you suspect trouble in the vertical deflection system, since you described amplitude modulation, not vertical deflection, of the spot.

I would first guess that you have hum on the CRT's control grid, or earlier in the amplification chain.

And the first place I'd look for that hum is in the power supply: the electrolytic filter capacitor may have become defective in its old age.

> not result in any further increase in RF output.

This is because the radio has a feedback circuit which measures the power output (actually it often measures the RF voltage output), and adjusts the RF drive to the power amplifier module to achieve the set amount. On the high power setting, the feedback loop cannot achieve this unless, obviously there is enough DC voltage to allow the amplifier to reach 5W output. The exact point where the feedback circuit starts to reduce the power depends on many factors, in this case it was 10.4 V. Probably most HT's are designed to fall close to this number, as the '5 W' NiCd pack supplies only 12.0V, not 13.8 or more that can come from a vehicle's electrical system.

> - DC CURRENT DRAIN AT EACH POWER SETTING WAS LARGELY INDEPENDENT

> BOTH THE RF OUTPUT AND CURRENT DRAIN REMAINED CONSTANT AS THE
> SUPPLY VOLTAGE WAS INCREASED FROM 10.4 VDC TO 13.8 VDC.
>
My tests with the power amplifier from a Motorola Mocom radio tended to

show that the amount of heat produced is controled primarily by the supply voltage and not the power output. In other words, reducing the RF output by reducing the RF input to the amplifier caused the DC input current to drop, but the "excess" DC input power (DC power - RF power) remained almost constant.

This is somewhat confirmed by your numbers above:
Medium power: (0.8A * 10.4V - 1.1W) = 7.22 W excess
High power: (1.6A * 10.4V - 5W) = 11.6 W excess

At 10.4 V, the RF output can be increased by a factor of 455% while the heat produced is increased by only 160%. The disparity would be even less say in going from 2.5W to 5W.

The efficient way to reduce power output is to reduce supply voltage, not RF power input (what the feedback circuit does). So an external voltage-dropping device is a very good idea.

>The implications of this final observation should be obvious. At 10.4
>VDC, the radio is consuming 16.6 watts of input power to produce 5 watts
>RF output. At 13.8 VDC, the radio is consuming 22.1 watts input power to
>produce the same 5 watts RF output. This means that an extra 5.5 watts of
>power is being used when the supply voltage is increased from 10.4 VDC to
>13.8 VDC. Since RF output power remains constant, that extra power is
>being dissipated primarily as heat.

That is the only place the extra power could go. The problem is that the feedback circuit is reducing the drive and making the power amplifier less efficient. Running 'open loop', you could possibly get 7W or more RF out, at about the same amount of heat. The limiter is set to 5W as this is generally considered a safe amount to radiate near a person's head for short times.

>you put them in a place where the heat won't cause problems.

Almost any transmitter with a class-C power amplifier is going to exhibit these characteristics, and could benefit from reducing the input voltage. Even if you use only low or medium power, internal heating will still be reduced.

For voltage dropping circuits, I might suggest the old 'active capacitor' consisting of a power transistor hooked up as a voltage follower, with a voltage divider connected to the base. By connecting capacitors from the base to ground to filter the voltage there, a large amount of ripple filtering can be achieved, which may help if you are having trouble with 'alternator whine'. The effective value of the base capacitor is roughly multiplied by the current gain of the transistor. The transistor will need some heat sink (in this example (13.8-10.4)*1.6 = 5.4 Watts). It could be kept cool by attaching it to a metal box. It is easier to remove heat from a transistor than from diodes. This circuit won't regulate the voltage very much, but you don't need to, just reduce it so the radio operates more efficiently. Another method would be a simple series resistor (about 2 ohms in this case) with a big capacitor on the radio side. Since the resistor is sized for high power, it doesn't have much benefit on medium or low other than the RC filtering effect.

If you are using a Astron or similar supply at home for the HT and nothing else that requires the full 13.8V, there is often an adjustment inside that can be used to reduce the voltage to 10 or 11V.

Subject: Info Syntor X radios

I need some information on several Syntor X radios. These radios are programmed for the 154.00 public service band.
1) Is it possible to reprogram these radios for 2-meter?
2) What type of equipment is required to program them?

All of the ID numbers are identical except for the serial #'s.
tx: CC3372 ID: T73VBJ7D04BK
rx: RC0291 MOD: T99VB+008W

Any information you can provide about these radios will be greatly appreciated.

Congrats on the move to the Midwest. I would like to do the same, only from California...

The last U-Haul I rented had binding posts on the dash with 12VDC available. I suppose we could tell each other that they did it for the Ham community, but my real guess is that they got tired of people butchering the wiring to hook up CB's. I know from several years of experience in repairing over-the-road trucks that some people will cut into any wire with power on it to hook up accessories.

Drive safe.

Subject: opinions on Standard C508A?

Hi,

I have had a C508A for about a month. Great HT, but careful of the
limited output power - even with an external antenna on a car I have
difficulty getting reliable QSOs thru repeaters. I am looking at buying a
"brick" amplifier to get round this. The other restriction is the audio
output is not enough for use in a moving car unless you use a headset.

Its best applications are the ones I bought it for - hill topping on
climbing trips and use in hotel rooms when travelling. Sure there is no
autopatch capability, but look at the size and price! The scanning
capability is awesome.

Last weekend I was able to access repeaters in San Francisco on 440MHz from a 12,000 ft mountain in Yosemite National Park - about 150 miles - all on the 3 inch long antenna! Also used it in the UK a couple of weeks ago - the C-508A built-in 1750 tone capability is needed to access British repeaters.

Let me know if you need more info.

Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much. However, I do have a couple of questions that I can't seem to find the answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the autodialer memory number (#1 in my case). The transmitter turns on when the PTT is pressed, of course, but then turns off when the PF button is pressed and then back on for the DTMF string. However, there is no (or very little) pause between the transmitter turn on and the sending out of DTMF. I use two repeater autopatches and neither of them likes this and it _usually_ results in a misdial. Question: Is there anyway to add a pause or a brief wait between the transmitter turning back on and the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220 repeater and my 2m HT, I have to wait for the 220 repeater to drop before I can transmit. This becomes a real drag when on a roundtable on the 220 repeater and it has a long hang time. Is there anyway around this? Is there a way to make the 742A act like a single frequency repeater on the 2m side (ie. sample the receive every few hundred milliseconds)?

Thanks....<re>

Hi Darrell,

I have a 742A and the only problem I had with it was that with the 6Meter
module installed, you had to turn the rig on, then off and then on again
because even though you had a display, you couldn't receive or transmit.

It turned out to be that the module wasn't "talking" to the
microprocessor for some reason. Changing out the VCO in the '42A did no
good. Finally they replaced the module with another one and it worked.

Other than that, I like it very much.

JAN offers very cheap crystals, but they frequently don't work! I bought
about a dozen JAN crystals for some 6-meter channel elements. When they
came in, I spent DAYS tyring to figure out why the 6-meter rig wouldn't
come up. The cause was 6 to 8 dead crystals! I tossed the whole lot as I
had no faith that the working ones would continue to do so.

From: Bill <Bill@survival.demon.co.uk>
Subject: Regulations Shortwave Transmitter/Receiver must fullfill (help)

A UK based charity has developed a pedal powered generator to operate a short-wave
transmitter/receiver working at (4.005 MHz). The use is to supply village to village
communication in Tanzania Africa. A small pilot project has successfully run for the last
12
years with commercial bought in equipment. The aim is to manufacture pedal generators and
short-wave transmitter/receivers locally in Tanzania both to save foreign currency and
provide
local employment.

A transmitter/receiver has been designed and 95 per cent completed.

Does anyone know what international regulations such a short-wave transmitter/receivers
would have to comply with? The project is based in the UK.

Thank you for any help anyone can give.

Bill

Butch, It shouldn't be that hard to put in an aftermarket tone board.
The factory board will only let you set it up for three different
frequencies, if I remember correctly. If you only need one frequency,
I would look at one of the miniature tone boards that Communications
Specialists sell. They are available from a lot of the mail order
places. They are very simple to hook up. The original factory tone
board plugged into a small plug on the 7950. My guess it was a B+,
GND and tone into the radio line. Even if it is not, you can call
Communications Spealists and they will tell you where to connect their
boards on most radios. I hope this helps....73's Floyd WD5ENJ

> I'm a rank beginner with my new tech licence, looking for my
> first rig.

Not to send you off the track of a HTX-202, but I've just heard about
the 4th radio in my county going on the blink. Intermittent transmit.
All the same problem. The latest one is 3 months old. Whenever used
on 12 V. it is on a mobile 5/8 antenna.

True, I don't know how many operators in my county have the HTX-202,
exactly. There are approximately 1300 or so amateurs that live in my
county. I'm sure they don't all own the HTX-202. ;-)

The ones that do work sound good. The owners like them. Just about
every owner that I have talked to has the extended warranty. (And it
is apparently pretty good tha they do have it...)

> Is it a good buy for $260? I notice that they bundle in a few
> options in the
> price, that others don't. Is there a better choice in that
> price range?

Considering the problems that I've heard with this HT, >if it were me<,
I wouldn't purchase it without the extended warranty. Figure another
$40 or whatever it costs onto the price of your HT. Now you're looking
at around $300. Is it worth that much? In my opinion, no.

Now if you get it for the sale price of around $190 + $40 warranty, you're
looking at $230ish. Yeah, maybe it is worth that to someone. Did I
say "Don't buy this radio without the warranty?" Well, if I didn't say it,
be sure you don't buy it without the warranty.

Actually, I think Radio Shack ought to adjust the price of their radio so it includes the price of the 5 year warranty. Of course, others may not think that way... I'm just going by the track record I've seen from locals on this radio...

I must add that Radio Shack has been very good to the locals in the customer service department. They stand behind their product. That is an important consideration when considering a purchase of most anything.

It is reported that the HTX-202 is very good in a high RF environment. It tends to not suffer from intermod interference. This might be something to consider, too.

All in all, I'm pretty neutral on the HTX-202. I probably wouldn't buy one for myself, but I'm not in the market for a 2M HT, either.

Contratulations on your new license and enjoy--

73,
Ken

>4) ... accessories

I got a 31 for the same reasons as Walt (I don't know him, he works
for another division of Loral).

I also got a IC-2341H for use as a local repeater in the parking lot
outside of our building. The building has this mylar on the windows
and blocks most of the radio signals (but not the heat during the
summer) :-(Having this combo allows me to talk to my wife who works
about 25 miles away. We're both using a repeater 1/2 way in between.

I have really come to love the 31. It's been in the seat of my dirt
bike (wrapped in a towel and plastic baggie), with the ICOM heaset
mike (don't remember the model number). It's also been on the back

of my bicycle, with it's rubber duckie antenna. This last one got
us out of a jamb, when we were lost on a camping trip. My wife was
able to talk us back into camp, using tall ridges/trees.

It's been used by the local sherrif when we were camping and there
were some kids lost, (he's studying to become a ham too now).

It had the mods done for out-of-band receive (haven't done the
transmit yet). Can receive 50Mhz - 700.95Mhz.

It's pretty easy to use, and seems to fit the bill just fine.

I owned a TR-33 right after they first came out. It is FM only, and I
do not remember the exact power, but it is only a couple of watts. It
is xtal control, but uses only one xtal for the repeaters. You buy the

xtal for the receive freq (i believe) and the radio has the ability to
offset that for xmit. I liked the radio, but then I also like the
TR-22. Wish they would sell something like that again.

Jeff,

I don't have an FT-51R, but I suspect you cannot hear stations in the FM broadcast band because FM broadcast signals use 75-kHz deviation, as opposed to the 5-kHz deviation used for amateur NBFM signals. Unless there is a separate filter for the broadcast signals, you won't hear anything.

Got this off CIS tonight. It was posted by someone from Icom support:

**** ICOM America, Inc has annonced to dealers on August 25, 1995
****

We expect to start shipping the IC-706 to the dealers on
September 27 - 29, 1995.

The following is a listing of retail pricing for the IC-706 and some
accessories.

IC-706 Transceiver $ 1560.00
CR-502 High Stablity Crystal $ 76.00
MB-62 Mounting Bracket Main Unit $ 20.00
MB-63 Mounting Bracket Ctrl Panel $ 14.00
OPC-581 3.5 M Seperation cable $ 48.00
OPC-589 8 pin to RJ-45 adaptor $ 28.00
OPC-598 7M AT-180 Extension cable $ 58.00
OPC-599 7 & 8 pin to 13 pin cable $ 48.00
UT-102 Voice Synthesizer $ 59.00

This is all I have pricing for at this time. I will update this list
as
I receive the information.

Subject: Moving in a U-Haul - Hook up my 2m help?

OK.. I'm (finally) moving out of the Washington DC area and out to Kansas. My wife and I were planning to use our 2m rigs to communicate (simplex, mostly) on the road. I've got a 5w HT that I'm going to rig to a mag-mount 2m antenna and a Yaesu 2400 (and another mag mount) that's in my house right now. I was planning to give the HT to my wife (who will be driving our car). I'm going to be driving the U-Haul truck we rented. Short of running it to the battery, the only way I can think of powering this thing is via the cigarette lighter. My question is: Will it blow up on me? The 2400 puts out 12A at high power, but since my wife will only have 5w at her disposal, I'll probably only be using low (3A) or medium (9A) power.Think this will work, guys?

Thanks in advance!

I won't get into the comparison here since I'm obviously biased, but
keep in mind that the top-of-the-line model from JPS is the NIR-12, a
dual-DSP unit featuring two different types of noise reduction -
adaptive peaking *and* spectral subtraction. The NIR-12 was introduced
at Dayton this year. There is a data sheet and a photo on the JPS web
page at
http://emporium.turnpike.net/J/JPS/jps.html
or you can email jps@nando.net and request one.

Most mail-order places have gel-cells but maybe expensive for the
higher quality cells.

I have a large number of new (sealed in package) Gates Cyclons:
48V/8Ah (in a 2"hx11"deepx16"wide steel enclosures), these
be broken down into 12V/8Ah and 6V/8Ah. I also have 12V/5Ah
(individual E cells in a white clam-shell. Can be rewired for
any voltage between 2 and 12 [multiple of 2]).

Datecoded 12-94.

If anyone needs some....

Subject: Yaesu FT-11R Mods Request

Subject: Yaesu FT-11R Mods Requested

>>...extended TX mods for the Yaesu FT-11R...

Date: Wed, 30 Aug 1995 09:26:11 -0700
From: mailfail@ucsd.edu

Date: (null)
From: (null)

This mod gives you extended transmission range on a Yaseu FT-11R.

I have knowledge that this mod works, but take no responsibility for any
damage it does to your radio, the legality of this mod, or any other
incurred damages.

After the mod a FT-11R will have:

Receive: 110.000-135.995 (AM) 136.000-180.000 (FM)
Transmit: 136.000-180.000 (FM)
Empty Memories and a completely reset radio

First, Remove the antenna, battery pack, and pocket clip (if installed)
from the radio. Then remove the four black screws from the corners of
the main section of the radio, the two black screws from the bottom center
section of the main body, and the two silver screws from the bottom of the
keyboard section. Now carefully separate the back and front halves of the
radio, taking care not to put too much strain on the internal ribbon cable,
or loose the small metal strap holder or the battery release button.

Once you have opened the radio, carefully remove the metal plate covering the back of the keyboard. Then remove the "AF" pcboard by first removing the two copper screws in the middle of the board, then holding the bottom of the pcboard and the mic/speaker jacks between your thumb and forefinger and pulling straight up. This may take a little force, as you are separating two connectors. Once you have the "AF" board removed, set it and the connector/keyboard backplane board aside. Now look at the lower left corner of the controller board. You should see the 8 jumpers (they are very small), set up like this:

Top of radio

L A o-o o o E I don't know how the jumpers relate to the
E B o-o o o F ones on the schematic, so the letters are just
F C o o o/o G for reference in this article
T D o-o o o H
"-" means a solder jumper, and "/" means resistor

These are the functions of the jumpers that I know of:
A- Turns your radio into the euro version (TX between 144.000-146.000)
B- ?
C- ?
D- This is the important one. Gives you extended TX range
E- Turns your radio into the 440Mhz version. Not Suggested!
F- ?
G- ?
H- Same as jumper "E"

The only jumper that this mod deals with is "D". It currently has a solder jumper across it. Remove the solder across the jumper with really small solder wick or a desoldering station, taking care not to touch any plastic with your soldering iron. Once this solder jumper is removed, you now have extended tx range. Now carefully replace the "AF" board first, and then the connector/keyboard backplane board. Take care to get the copper grounding connector on the side of the mic/speaker jacks well seated. Replace the two copper screws in the middle of the "AF" board, and the two silver screws on the bottom of the keyboard. Replace the battery eject button and strap holder, and then replace the back half of the radio. Replace a the screws, put the battery and antenna back on, and turn the radio on. You should see 144.000 on the screen. Turn the radio off and the hold the MHZ/\ and MHZ\/ buttons while turning the radio on. You now have the transmit range between 136.000-180.000.
As a suggestion, you can store completely different transmit and receive frequencies in a memory (see manual), so if you store a service frequency in a memory, you can program a legal HAM frequency as the transmit freq. so you never accidentally transmit on an illegal frequency.

Another neat feature that I have found on these radios is the "Clone" feature. You can transfer all memories from one FT-11R to another FT-11R. First, make a cable using two male stereo 1/8" connectors,
and connecting the top(ground) and middle conductors of the plugs straight

through. Don't connect the tip conductors together though. Plug this cable
into the earphone jacks of the two radios, and on each radio, hold down the
"FM" button while turning it on. You should see every character flashing
on the screen. Now, on the radio which you wish to receive the memory
contents from the other radio, press the MHZ\/ button. You should see
"RX CLN" on the screen. Then on the radio which is to send it's memory
contents, press the MHZ/\ button. "TX CLN" should appear on the screen for
about 5 seconds, then it should return to the flashing screen state. The
receiving radio should now be in normal operating mode. Turn both radios
off, and remove the cable. That's it. This function overwrites all of
the receiving radio's mem contents, and copies everything from memories
to pager codes to the status of the light. WARNING: The instant that you
hit the MHZ\/, your memories are GONE, even if the transfer is unsuccessful!
Also, both radios must have the same jumper settings to successfully
complete the cloning process.

This whole notion about not selling equipment to unlicensed operators is ridiculous! The only thing you are going to accomplish is the loss of the profit you would have made on the radio!

Consider:

Anyone who wants an amateur radio can get one; they are widely available: inexpensive 2-meter and 440 handhelds can be found at any Radio Shack store. For 10-meters, it's even easier: show me a truck stop that doesn't sell Rangers, Emperors, etc.

Wake up people!! Not selling radios to the unlicensed? Ethical, yes but practical? Not hardly.

1569. Need Info, TRIO - TKMS-4205 UHF radio

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-05 00:00:00 UTC
From: fitr%mimi@magic.itg.ti.com
Message-ID: <42gsp8$306@tilde.csc.ti.com>
Source record: 212901

Hi All, I've come across a UHF radio, a TRIO (Kenwood) TKMS-4205. This is a 5-watt output, single crystal, UHF rig designed for the Japanese Taxi Service. Appears to include built-in CTCSS encode and decode with the microphone-to-ground listening scheme. It is currently operating on 465.150 with a separate TX and RX crystal.

The receiver has an excellent helically filtered front-end, posts sensitivity of about 0.12uV on-the-bench, output tx is 5 watts, and appears as durable as a Motorola (all metal case, super HD bracket, BIG front speaker, 4 watts of audio, etc. etc). and I'd like to convert this to 430 FM for a remote receiver, or packet, or ???.

Question: Any idea of the crystal scheme? A call and several faxes to Kenwood Japan have revealed _NO_ information. JAN had no idea either. Also, probably I'll need to retune the receiver but dont have a service manual.

Anyone know if these were available in the USA or Europe or have more info? Inside datecode reveals about 1984 vintage gear.

Thanks,

1570. UK Reciprocal license procedure/am. radio mod

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-05 00:00:00 UTC
From: anb@nextstep.com
Message-ID: <anb-0509950254470001@dial-berk1-9.iway.aimnet.com>
Source record: 212942
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.policy,alt.radio.uk,uk.radio.amateur

Two questions regarding my upcoming trip to the UK:

Briefly, could someone outline the basic procedure for which I can obtain a reciprocal license to operate amateur radio in the UK? To whom do I apply, how long does it usually take, and how much will it cost?

In a related vein, I have been told that radios manufactured for sale in the US are not equipped to transmit a tone which opens up repeaters throughout Europe. I own an Alinco DJ-580T handheld dual-band, and I know there is an Alinco DJ-580E which is nearly identical except that it is manufactured for use in Europe. Is there a modification I can perform, or is there an accessory I can buy to make my handheld repeater-capable when I visit the UK?

Please reply via e-mail to: anb@nextstep.com

Thanks very much for your help,
Andy Brandt, KE6SKH

As for frequencies, I'd go after two of the most listened to yet not even widely known VHF frequencies. Try 121.5 MHz and 243.00 MHz.

There are a huge number of listeners there and it is the very best place to immediately have an audience.

You might notice that 243.00 is an exact multiple of 121.5 and this is no accident it is called an HARMONIC. The SECOND HARMONIC to be exact so you can transmit on 121.5 with a homebrew kit and stand a very good chance of being heard on both frequencies.

Most listeners will be using AM receivers but you can use an FM transmitter and still generate a LOT of attention to your new station.

An afterthough to the wannabe pirate.

I do hope you realize my post was all in fun. Don't even THINK of transmitting on either of those two frequencies!!!! Oh, my God, yes you WILL have an audience but NOT the kind you would care for.

And pirate radio of any sort is ILLEGAL!!!

The FCC has very sharp teeth indeed. I suggest you forget the whole idea.

Sure there are. The property belongs to him and the fact it's present in his storefront doesn't give anyone the right to take it without his permission, whether they pay him for it or not. As the owner of the property, he has every right to determine the exact conditions under which he's willing to part with it, whether it's price, terms, use or anything else. What moral grounds whould you propose in forcing him to do otherwise?

>(I'm not an attorney....just using common sense...and I sell amateur
>equipment to unlicensed individuals all the time.)

That's too bad. Most of the dealers I've known had higher standards.

>SWL...

Yep. he sure is... He has a stake in following the regulations.
Violate them, risk loosing his license as well as being fined..
A lot of hard work and effort went into getting that license...
Few will risk loosing it..
An SWl has no risk othe than a fine...He has no license to
loose.

>Although I realize the rights of business owners to make up their own

You would have been allowed to purchase all the non-transmitting
equipment you wanted in our store...
In the 20 years I owned the store, until my partner died, we lost
only 4 sales because of our policy..
2 people sued us and lost...
2 people bought gear from the place that sends out those
nice slick catalogs with locations in several places..
They were caught, fined, and lost all their equipment
to the FCC....who later auctioned it off to "Licensed Amateurs"
only...

>socially determined need.

When needs and laws are determined for "social" reasons rather than
the preservation of easily recognized individual rights, we have
ceased to be a free society.

>2) There ARE vendors who do sell to unlicensed persons.

Immaterial, and the case isn't just weak, it's morally bankrupt. The
vendor owns the equipment and it is his property to do with as he
pleases.

Pass a law that prohibits this, sue and convince a jury he is wrong,
and you have merely proven once again that the U.S. has ceased to be a
free country.

Is anyone else tired of this concept that every member of society is a
victim at the hands of buisiness, and that every hardship must be
someone else's fault?

If you are looking for a good 2 meter HT, I would consider Radio Shack's HTX-202. It is a basic radio which won't allow you to receive out of the two meter ham band, but because of this, Intermod is reduced greatly. I have two of them and they perform better on 2 meters than my Icom V21AT's They have all the features you need to use any local repeaters and are fairly rugged. They are on sale now at Radio Shack for $199.00

>amateur equipment to non-licensed individuals?
>Just because someone "owns"
>merchandise doesn't give the absolute right to refuse to sell it to
anyone...
>That would open the door to a discrimination lawsuit, don't ya think?

Yes it does. If I own a piece of equipment I can sell or not sell it to
whomever
I wish. Just as a business establishment can refuse service to any
individual or group of individuals as long as there is no "malicious intent
to discriminate." He may also have to prove this in a court of law.

The only law prohibiting the sale of amateur gear to non-licensed
persons in the US is the sale of linear (or otherwise) amplifiers
that are capable of operating in the range of 22-30MHz. It is also
against the law for a non-licensed person to possess such a device.
I personally don't think it is a good idea to sell your rig to a
non-licensed
person that you don't know. However I have sold equipment to unlicensed
people that I know who are now hams.

That's it.

non-licensed or unlicensed => no ham license for you legalistic types.

From: n4lq@iglou.iglou.com
Message-ID: <DEHppH.569@iglou.com>
Source record: 212710

NO ..The main reason is due to the narrow bandwidth of the AM filters in the transceivers. If you want high quality audio you may have to install an optional 6kc wide AM filter in your IF stage. Transcievers were not designed for hi-fi rather they were designed for sharp selectivity in both the IF and AF stages. Usually the audio rolls off at about 3kc making them sound rather dull for music anyway. Usually, even cheap shortwave radios can sound better than the megabucks ham rig.

Get one with a metal cabinet. I've used old IBM ps-2's and they are
pretty quite. Keyboards can radiate a lot of hash. Be sure it has a well
shielded cable etc. Processor speed doesn't make much difference because
your I/O speed is only 9600 baud anyway. An 8088 will even work fine.

Bad idea. The 850 speaker will enhance the resale value of your radio.
Stick with the proper one. The sound difference wont matter. If you want
good sound then you need to get a large HI-FI speaker.

Herb Rosenberg (herbr@netcom.com) wrote:

1591. AEA PK-232MBX & Yaesu FT-736R

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-06 00:00:00 UTC
From: kory@avatar.com
Message-ID: <42klmo$sjg@avatar.avatar.com>
Source record: 212713
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I have a AEA PK232 TNC and a Yaesu FT-736R rig. The 736 has data in/out jack for TNCs. This method bypasses the FM modulaters pre-emphasis and de-emphasis circuits. Its suppose to be better, unless the TNC already compensates for this, in which case it would be worse. The Yaesu manual states that most TNC-2 clones already do the compensation and I believe the PK232 is a TNC-2 clone. I've been trying for two days now to call AEA and ask them this question, but the tech support lines are *constantly* busy.

The main reason that I want to hook up my TNC this way is that I don't have to plug/unplug the TNC and Mic and Speaker jacks. I know I can buy a switch box from MFJ, but then thats two more gadgets that I really don't need.

Thanks,
Kory

SERIOUSLY consider one of the smaller and equally featured
handhelds from Kenwood or others. I have a Kenwood TH22AT
which is about half the volume of the RS rig --- truly
shirt-pocket size. Price shop the mail order houses listed in
the back of QST or other ham mags. Especially note any place
that is advertising a 2-day or so "Kenwood days" sale, which
saves even more money. I paid $230 (in the spring of '95) for
my TH22AT, no shipping charges, no sales tax. Compare that to
a RS on sale for, say, $189 + 6-8% sales tax and some (like
me!) would ask why you would want the RS unit.

But, each to his own, and one thing that's hard to beat with
the RS stuff: just about every county in the country has a RS
store. You can go there tonight and bring one home!

I would have to guess not. I have it's predecessor, the DR600T, and I must have bought one of the last ones before they changed the radio. A buddy of mine bought the same thing (so he thought) a couple/three months later, and it was marked DR600T/B. This 'upgraded' radio had the 800 MHz front end parts deleted. Other than that, it was the same.

>SLO County Amateur Radio

I have converted several GE MVP, Mastr Exec II & Mastr II 450-470 MHz mobile units to amateur repeater service without any modifications to the RF PA. The only problem I have run into is cooling, particularly with 35 W & higher units. I have also had problems with 35 W PAs 'melting' at the collector fin of the final transistor. In one PA I was able to fix this by replacing the transistor. I have also had problems with 35 W Mastr Exec IIs at the main radio connector: the PA power pins would build up a small resistance, overheat & char, leading to eventual power circuit breakage at the connector.

In general, the 20 W PAs are rock solid, & the 35 W & higher can be made to work but they need a little TLC. Your specific case sounds like a flaky final transistor.

1601. Kantronics Rock Hound

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-06 00:00:00 UTC
From: John Shuster <shuster5647@delphi.com>
Message-ID: <BnFhkf8.shuster5647@delphi.com>
Source record: 212723

I picked up a Kantronics rock hound QRP unit. It has a 40 meter novice band crystal, a key jack, and a female RCA jack marked "antenna". Where do I attach a power supply? I called Kantronics and the only help they could give me was to say that they stopped making it in 1976. Makes me want to buy one of their TNC's...8^(.

Any help appreciated.

John in Seattle KC7CKP

>Jim N6OTQ

While you can "get by" with this method, it is a very poor one. Two
things are being ignored. By dropping the audio input, you will never
reach the level where clipping or compression begins and will lose
considerable average level. Second, you are doing nothing to narrow
the receiver to the expected signal. Adjacent channel problems
can/will come up, as well as poor audio recovery from the received
signal.

Installing narrow IF filters and changing a few components in the
detector circuit, can improve the situation considerably. In some
cases, you might be able to just turn the deviation pot down on the
transmitter and get by with it.

Don't have a false sense of security here. Fisherman among others use the amateur bands all the time, Unlicensed, and with scramblers installed in the amateur radios. many boats have radio direction finders that are far better than the typical amateur with his fox hunt gear.
The amateur bands are more private than the VHF marine radio frequencies for charter boat fishing. How ever they also use
the so called " private channels " in the marine VHF radio frequencies.
Hang gliders also use the amateur bands and usually have the radio modified to use them on 151.625 MHz. The amateur transceiver is cheaper than the correct commerical two way radio. There is a very good scrambler company who can install one of their scramblers into most any amateur radio transceiver. The point is amateurs take advantage of the out of band coverage todays radios offer, while others take advantage of the extra frequencies the modified amateur radio s offer, amateur bands and all.
It's a two way street out there today. Many non amateurs use modified amateur transceivers for business band operation, legal or not.

Get into the Amateur radio business some time, and you will have a big eye opener.

AZ>: A basic rule of contract law (which includes sales) is that both
AZ>: parties enter the transaction willingly, so if the seller doesn't want
AZ>: to sell to the prospective buyer, no sale.

And if whites don't want to sell food to the blacks, then I guess they
the above rule means that the blacks are gonna starve. Laws can not be
treated as absolute so long as just minds prevail. I believe that the
person who claimed that denying sale of goods to unliscensed persons was
unjust had a point, so long as we realize that in this example, the
reason that the denial was made was that the seller was trying to impose
laws on the purchaser that did not as then exist. (However, there must
be other reasons that denial of the sale could be justified.)

The above basic rule does not speak about all areas of conduct. There
is behavior that society does not consider reasonable. The argument is
probably overly weak in this case because of two reasons. 1) Radio
equipment does not fall into the category of a socially determined need.
2) There ARE vendors who do sell to unlicensed persons.

In my defense, I suggested a 0.02 fix on a $20. rig.

If you want a 25-year-old military surplus rig to work like a $900 1995 rig, you can do it. But it's going to cost more than $900 if you figure your time as worth more than minimum wage.

A speech processor (properly adjusted) is useful on any rig. There's no telling what condition the existing audio shaping circuitry is in on a surplus rig that's old enough to vote. Getting the deviation down to where the rig can be heard and understood on the air is the first step. Better receiver filtering is esssential as well -- but you can buy a superior one-chip FM receiver from Moto for $3. Do you want to go through a varnish-laden IF chain to get a couple more dB when you can go to Radio Shack and buy 20 dB and a hamburger for $5?

I am a strong proponent of CHEAP test lash-ups that provide a go/no-go initial test on surplus gear. It saddens me when people spend hundreds of dollars testing and tweaking a tin-can radio when they could have put a nickel bandaid on it, had some fun, and put the money toward a nice rig -- either a modern rig or a classic that's worth the time and money.

BTW, is there any place in the country where there's enough 6 meter traffic for adjacent-channel rejection to be a factor?

Dear colleagues,

does anybody know what type of transistor is used in the final
stage of the Mini Circuits wideband amplifier ZHL-1042-J ?

Mini Circuits does not make spare parts available for this
amplifier. A new amplifier costs about USD 500.

Until now I just got one useful info. It was Mike, KD4QDM, who
told me that the transistor is probably a GaAs FET from Avantek.

Does anybody know more ?

Now there's a brilliant idea. I guess a novice is more "qualified" to own a transmitter that transmits in the Advanced class bands than a SWL...

Although I realize the rights of business owners to make up their own rules, I exercise my right to go elsewhere whenever I hear policies like this from ham stores. Having experienced it before I was licensed (buying a TNC, not even a transmitter...), you won't find me spending my hard earned cash around those places now that i'm "allowed".

1) Reset the radio according to the instructions in the manual. You hold down one of the keys and turn power on. I don't have a manual here at work, but it is in there.

2) How do you know it isn't transmitting? No LCD indication? If you are trying to read it with a mater not rated for the frequency, they may show nothing.

3) Connect a DC Ammeter in line with the radio. If it is not drawing additional current during transmit final transistors are most likely. If it is, there's power going somewhere.

Kenwood has all the parts for those band units you will need. Changing the finals or the driver is tricky - you may want to let them do it if you do not have experience in this area. You can ship them just the band unit for diagnosis, too. I have to tweak mine back on frequency about once every 6-8 months, but the newer units are better, I understand.

Good point, Bill. I don't use autopatch, but I can definitely see the need
for lighted buttons.

Which brings up another point for the originator of this thread...the
battery dies, virtually without warning. It has cut me off in
mid-coversation more than once.

My wife just became a ham, and she bought a Yaesu FT-11R this weekend at the
Southwestern Division ARRL Convention. With its many features, I'm
beginning to hope that both my 202 and 404 die, so I'll have a reason to buy
the FT-51R. :)

Does anyone know if the 51R can be modified? If so, what frequencies does it receive? Where would be a good place to find this mod?

Thanks,

DE KE4WPP

1630. What TNC for 2 Meter IC2000H for KISS?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-06 00:00:00 UTC
From: danc@cts.com
Message-ID: <DEGv0M.7Jt@crash.cts.com>
Source record: 212885

I recently passed my no-code tech exam and I am trying to determine which TNC would best suit my needs. I have an HT202 and was thinking about getting a KPC-3. I also recently bought an IC2000H and a KAM PLUS. However, now that I have the KAM PLUS and have actually seen the specs, I 'm thinking maybe a AEA PK-96 9600/1200 bps Packet TNC would have been a better choice. I'm really only interested in 2 m, so I'd probably never even get a chance to use the KAM PLUS's (HF) RTTY/ASCII, AMTORm CW, NAVTEX, PACTOR, G-TOR modes.

I am mostly interested setting up the IC2000H with KISS and would prefer it operate at 9600 than 1200, yet use 1200 packet with the KPC-3 and HT202.

I would appreciate comments with anyone that might have experience with this equipment. I am running a LAN between a Win 95 box and Linux box, and I was planning on setting up the KISS on the Linux Box. Thanks.

If you have a Macintosh, you can certainly use it with an external
all-mode TNC; there's quite a bit of software to be found.

Of course, it doesn't rival the software base on the Intel platform;
unfortunately, most of the extra found for Intel isn't all that great
anyway.

If you need to buy a machine, Macs rival PCs these days
performance-per-buck, and so should be considered. But it's up to you; I'm
not going to get into a Mac-vs-PC war. ;-)

Cheers.

I have been using rapid chargers for the batteries used in cordless drills for the last 5 years. My use is everyday, as a professional woodworker, I use cordless drills a lot. I have a total of 5 of the them, with two batteries for each. Over this period, I have had only one of the batteries go bad (and that one was a "no-name" brand.

My conclusion is that a well designed rapid charger will not harm the batteries that it was designed to charge. Make sure the charger has the proper sensors to monitor battery voltage and shut-down when the proper voltage has been reached. Current limits for the initial part of the charging cycle are also important for long battery life.

Hello all, I was considering buying a Scout for my vehicle, but
I ran accros a ham who sent his back because of the fact that
the radio compensates for it's frequency in 100 HZ increments
right in the middle of a word.
Now the question is..

Has anybody else experienced that?

Has anybody talked to Ten Tec about this , and has Ten Tec resolved it?

Is this a significant problem or not? I'm interested in peoples reaction to
this that use the rig mobile.

Does anyone know where I can buy a PC card that receives the govt time signal and keeps my PC clock in sync? I saw something like this advertised years ago but cannot find it. Ideally, it would TCP/IP software so the PC can act as a network time server.

1645. Best SW Control Program for TS-850S

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-07 00:00:00 UTC
From: jduerbusch@gwsmtp01.mdc.COM
Message-ID: <s04ef0c4.064@gwsmtp01.mdc.com>
Source record: 212733

Herb Rosenberg asked options on SW for the TS850S. I use two SW
packages that work very well with my TS850S.
1. Rgmgr21d.zip is a windows based program written in Visual Basic. It
is a rig control software, no contest control, but is super!
2. Rigeqf20.zip is a DOS based software, but can be run out of
windows. It also is very good, easy to install and run.
Both SW packages are available on the QRZ CDrom, or can be
downloaded from FTP.QRZ.COM in files/rigctrl directory.

Good Luck (now if I could only get my 850 back from Kenwood)

: 52.86RX/52.36TX KC6WGR (So Cal 6m Club)
: 52.56RX/52.06TX ditto

I had an opportunity to get some good local info on 6m this weekend, during a talk promoting that band, at the ARRL Southwestern Division Convention on the Queen Mary. One of the handouts was a lengthy (one page, both sides) repeater listing for SoCal. If anyone is interested, it would probably be much easier to FAX it than to enter the info on here.

Anyway, one of the points brought up was that the 6m repeaters in the LA area are mostly high-level, and it's a good idea to have 50 watts or more to do any useful work. Just thought I'd toss that in.

1649. Drake TR-3 refurbishment, worth it?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-07 00:00:00 UTC
From: smithj@innet.com
Message-ID: <42mm36$dsu@lucky.innet.com>
Source record: 212737

I've always wanted a Drake TR series radio, ever since I got interested in Ham Radio back in 1976, and finally swappped for a Drake TR-3. Like many tube rigs of it's day when they get this old, the higher one goes in frequency, the lower the performance, especially on 10 meters.

In the humble opinion of the Net.Hams, is it worth trying to rework this rig for good performance on 15 and 10, or just leave it as a nice rig for 80/40, with an occaisional trip to 20?

Jim Smith N8AVX

> BRET A. PENNINGTON

Bret,
Here are the plans for a copper J-pole, which I followed with great
results. I made the 5/8 wave version, which requires one 10ft piece of
1/2"Copper pipe.
Have fun

73s, Steve WA6TAF
_____cut
here_____
"Here's a variation on the twinlead J-pole design that uses copper tubing.
The dimensions are a little different and the feed is different from what
has
been previously posted but then that offers some opportunity for
experimentation (which is part of what amateur radio is all about). I
haven't
personnally constructed one of these but I know several local hams who have
and they are very pleased with the results. This makes a very unobtrusive
and
rugged antenna."

from
John Keith, KD0GD

SIMPLE J POLE ANTENNA

The J-pole antenna offers good gain, compact size, simplicity and very low
cost. They are easy to build and compare very favorably against
commercially
available antennas. As a side benefit they are DC grounded for lightning
protection. The construction style provides for a very durble antenna and
one
that is very easy to mount. The total material costs should be about $10.

Material list:

1) One ten foot piece of 1/2" rigid copper tubing
2) One 90 degree elbow fitting
3) One T fitting
4) Two 5/8" rubber chair leg caps (or 2 copper end caps)
5) Two small stainless steel hose clamps

Construction: |
|
1) Cut the copper pipe to the following lengths |
(save the piece that is left over): |
57" (66 1/2" for a 5/8 wave) | 57"
19" | (66
1/2
3/4" (used to join the two fittings) | for
5/8
2) Using normal plumbing techniques (solder, |
wave)
flux, torch) connect the tubing as shown | |
in the illustration. | |
3) Install either the rubber feet or solder 19" | |
the copper end caps in place. | |
90 elbow-> |--| <-
T
Tuning: |
fitting
|
1) Attach the hose clamps about 3" up from the | <-
left
bottom of the "U" (5" for the 5/8 wave). |
over
2) Attach the inner conductor of the coax to the
19" side and the braid to the 57" (66 1/2") side.
3) Check the SWR. Slide the clamps with the coax up
or down until a 1:1 SWR is achieved

If the copper color is not to your liking, paint it any color you wish. It
is
strongly suggested that you use a good silicon compound to weatherproof the
coax connections against the elements.

>
>Comments?

It is a good radio. Rugged, Good speaker, Good mic quality, has tones,
puts out more watts than other HTs (7-9 watts). But only has 12 memories.
And it has reliability problems, many die. I've got two that died.
Luckily Radio Shack has a $40 five year warranty. No other maker offers this.
When my second one I had warrantied went bad, they took care of it promptly.

Its a good radio, but DO get the warranty.

1653. Amateur Radio Manufacturs On-line List

I have made a list of Ham Radio Manufacturs that are on-line.
http://pages.ripco.com:8080/~aclr/email.html
The list keep on getting updated so check it everytime you need to
talk to a rep.

I also have a list of radio mods.
http://pages.ripco.com:8080/~aclr/radio/mod.html
Its just like the one at oakland.edu, but better.

Thanks for the responses. Looks like I'm gonna go out later today and get a 202. The lack of expanded receive is no problem...I have a Bearcat 200XLT that I can receive with. Besides, it cuts down on imtermod, or so I'm told.

Thanks again,

Drew

P.S. Oh yeah...I checked the Web server this morning and I'm in!

The Yaesu manual is wrong, but the end result is correct. The mic plug
should be used with the PK-232 (which is *NOT* a TNC2 compatible!) at
1200 baud. The reason you WANT the pre-emphasis circuits of the radio to be
used has little to do with the TNC - it depends upon the receiving TNC's radio
connection: both ends should either use pre- & de-emphasis, or not. You
mustn't have one end using it and the other end not, that will cause problems.

Forget the MFJ box, build your own.

Marvin,

There is a WWV Timing Receiver called the TimeLink3 by a company
called TrueTime that hooks up to a PC via the serial port.

It is marketed by:

Personal Computing Tools
90 Industrial Park Road
Hingham, MA 02043
1-800-767-6728 (Voice)
617-740-2728 (Fax)

If you call them up, they will fax you the spec sheets.

>this question, but the tech support lines are *constantly* busy.

The PK-232 isn't even *close* to being a TNC-2 clone. It uses an
entirely different modem design. But it does still have tone twist
at 1200 baud. At least, unlike the TNC-2, the twist is in the
correct direction to compensate for the radio's emphasis/demphasis
circuits in the microphone amplifier. The MF10 in the TNC-2 is setup
to give exactly backward twist, no wonder people have problems. Ideally,
you want to supply flat twist to the modulator, but given all those other
people out there with backward twist, leaving the twist as is on the
PK-232 isn't a bad idea.

>The main reason that I want to hook up my TNC this way is that I don't
>have to plug/unplug the TNC and Mic and Speaker jacks. I know I can buy
>a switch box from MFJ, but then thats two more gadgets that I really don't
>need.

Unfortunately, most TNCs don't mute tx audio when they are idle, and
I believe the PK-232 is no exception in this regard. That means if
you try to use the mic while the TNC is powered, you'll get random
packet tones mixed with your speech. So power down the TNC before
trying to talk. Conversely, the 736 doesn't mute the mic when you
transmit tones from the TNC, so either be very very quiet, or unplug
the mic when doing packet. Seems you can't win in your quest to
avoid a switchbox or plugging and unplugging cables.

> shouldn't be power on the bottom of the radio, but I picked up the
> habit with ICOM 02ATs and 03ATs, and some habits are hard to break...

Hi, I'm the tech who fixes the HTX202s when they do break...

There is no reason to take the battery off an HTX202 when operating
from a DC power source into the jack on top (by the ant. jack) The
radio will draw power from the source with the higher voltage.

however don't transmit while using the charger on the nicad pack, on
the radio, as this may damage the charging circuit. it's a good idea
to take the nicad pack off the radio while charging just incase...

If you have any other questions on this unit feel free to E-me.

Are there any files or programs for the Macintosh, ie. is this a PC/Mac compatible cd-rom?

I use a Power-Mac and have Softwindows to run Dos and windows software, but I prefer native software for the speed and ease of use. Can I use your product with my system?

-Does anyone have a schematic for the Radio Shack HTX100 10 meter rig,
-or has anyone added seperate low-level transmit and recieve?
-I'd like to use mine for a 28mhz tunable if for a DEM 432 mhz IF
transverter.
-
-Thanks,
-Joe - AA3GN

You can go to your "friendly" neighborhood Radio Shack store and
ask for a Service Manual for your HTX-100. They cost around $15.
This is the book that is used by the service technician.
I think you can also call 1-800-THE-SHACK and order it on your
credit card. It won't have anything about modifications but it has
a detailed schematic. As far as the low level transmit you might
be able to modify the output section for low level output.
I guess you are looking for the milliwatt range. It might be easier
to build a 30db attenuator.

WB>Then I assume you won't complain the next time an illegal CB'er
WB>clobbers you on 10M with the gear he bought from the dealers you
WB>patronize?

If I disagreed strongly enough with a person's sales decisions in the marketplace on philosophical grounds, I might decide not to shop at those places. This is a rather weak statement in a large marketplace, but if enough people feel this way, it could have an effect.

However, I would also complain when an illegal CB'er clobbers me on 10M with the gear he bought from the dealers that I patronize. Why ? It ought to be easy to see. When he clobbers me, being unliscensed, he is doing an illegal thing. The fact that there is a law against it means that socially we have determined his actions to be harmful. However, in the former instance, there was no such law. In that case, neither the buyer nor the seller is breaking any law. Neither are the other category of sellers breaking the law. They can refuse sale to whomever they wish, so long as no law comes along saying otherwise. It has been in some cases that the law has had to do that, since prejudice is alive and well in the world.

Standards ? There are many legal and ethical reasons that an unliscensed person would have a genuine and legitamate interest in buying a tranciever that he was not liscensed to transmit with. A salesman with high standards might be one consciencious enough to be sure that the buyer knew what he was buying. Of course, in the course of the discussion it was admitted that the intent was to break the law, then I think an ethical seller must refuse to sell on those grounds.

From: tomas.wennstrom@swedx.ct.se
Message-ID: <3e929794@swedx.ct.se>
Source record: 212751

Hi!

I'm am 16 years old and are going to buy my first a H-T, but I don't know
which one to chooce.
After going through my economy the possible options left are:

IC-T22E
IC-W21E
IC-W21ET
IC-T21E
and FT-11R

I would like to have some feedback about these radios, cause I don't know
anything about them.
Or maybe, if there is someone else that's better, then let me know.

I know about one problem with T21E. The antenna plug isn't a standard one.
I think it's a SMA conntact.
Is this good, bad or what? How do I solve the connection problem
when I put my radio to a external antenna?

A other problem is that I don't really know my needs.
I would like to operate mobile and therefor a car antenna, external
microphone and cigarette lighter cable are included in my budget.
I would also like to operate bicycle-mobile. What's needed for that kind
of operation? Any ideas or suggestions?

As a new ham, it's hard to know what's right and therefor I hope someone will
share his knowledge.

If the above questions are a FAQ, I'm sorry.

I know this is a little off topic, but I posted first to r.r.cb and got exactly zero response. Since I know you guys are a lot more knowlegable, I'm hoping someone might have some info they could give me. Skip the first question about the CB and just go to the VHS and licensing question. Thanks a bunch.

Original post:

Hi,
I'm pretty new to radios, etc. but I've got a couple of questions that I hope someone could answer.

First, I'm looking at a handheld CB unit in the damark catalog (Uniden Pro 340XL if anyone is interested) and it has a switchable power output of 1W or 4W. I know that the antenna makes a great deal of difference, what kind of useful range could I expect out of that unit?

Second, the other option I'm looking at is a pair of Motorola 1W red and blue dot (VHF) walkie talkies. I know we'd need to get class 3 radio operators licences to use them, so: a) could I expect better or worse range between the two of them (the blurb says up to 2 miles) and b) What is entailed in getting the license?

And, finally, (and maybe I should have asked this first) what I need these things for is, first, to communicate with another car during a cross country move, and then I want to be able to use them on the ski slopes, just to keep in touch if our group splits into two. With this in mind, can anyone tell me if I'm way off base, and I need to rethink my philosophy, or else can someone make a recommendation for a pair of resonably sized, not to cumbersome units that would fit the bill.

Thanks for the input,
e.

Personnaly I would go with the VHF (not VHS) units instead of the CBs. They should be quieter between conversations and will have the same or better range as long as you are line-of-sight (which both uses indicate you will be). There are several companies that sell a 4-5 watt version of those VHF radios. Even Radio Shack has a few. Of course you could also study foir and obtain your ham license. A 2 Meter handheld will alsoi meet your requirements and also open up an entire hobby for you.
Good Luck

I was wondering if any mods are available for this rig. I realize this is an older rig, however, I just purchased it and would like an answer.
Thanks for helping.

That did not stop an enterprising collection of CBers out here in wonderful So Cal from building one and operating it *5 YEARS* before the FCC managed to nail 'em and firmly slap some wrists. (This went down a fair number of years ago now.)

I recently fried the CAL module on my Hickock tube tester, and since it's potted in epoxy it's impossible to reverse engineer. Does anyone have a schematic, a spare module, cardsets, or even a complete operational tester

they'd like to sell? Any and all help will be greatly appreciated, and promptly rewarded.

1675. Question of TS830 coil

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-08 00:00:00 UTC
From: mkelly@brisbane.DIALix.oz.au
Message-ID: <42o4pd$3ar$1@brisbane.DIALix.oz.au>
Source record: 212763

Someone (I forgot to note who) asked for the value of a coil in the final of the TS830S. Knowing there was very little (or any) difference with the 820 final I can say the L2 in the 820S final (on the SG supply) is listed in the workshop manual as 470uH.

Hope this is of some help.

Murray Kelly. vk4aok.

Dose anyone think that they would not be able to buy any kind of HAM
equipment if they did not have a ticket. If I was ever asked for my
call sign, it was just for their record keeping. If I picked a call
from somewhere, I am sure it would get by, but thats not the point.

How many HAMs bought there HF tranceiver to use it to copy code over
the air. That way it was a tool to learn code and an incentive to
practice. Am I the only who has hard of this method of passing the
test?

People can buy guns that can kill (so can a knife), but it is the
responabilty of the owner not to break the law. Most owners of guns and
knifes do not go and kill someone. There is no law against owning a HAM
tranceiver without a ham licence.

1680. Alinco DT150T with AM

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-08 00:00:00 UTC
From: Coen Waasdorp <waasdorp@inter.nl.net>
Message-ID: <LpyqCIAT7JUwEwqd@inter.nl.net>
Source record: 212768

Hi all,

I just started working with the Alinco DT150T. In principle it is a 2
mtr FM transceiver with the ability to receive also the air band.
The communication on the airband is in AM and I noticed, after having
selected AM through F-Mhz switch, that the transceiver goes
automatically back to FM when changes frequencies.

So scanning on AM is, apparently, not possible as the transceivers goes
back to FM all the time.

Does any one have experience with this rig and is having perhaps a
suggestion how to keep the receiver on AM while scanning.

Tks,

brgds,

>- Used equipment in good shape is a better deal than buying new. Buy
>locally if you can. Bring a friend along. Also scan the net to
>get an idea on prices.

Good idea. I will admit some of the newer HTs really are better than
some of the older models, though, but you'll pay for that.

>- Make sure it can receive on both bands at once. The TH-77 can send
>audio from one band to a speaker-mike, with the other to the built-in
>speaker. Some so-called dual-banders can only recieve on one band
>at a time.

Even better, look for one that can monitor V/V or U/U as well as just
V/U. That's *very* useful since you'll often want to keep an ear on
two different repeaters in the same band. This is much better than
just scanning.

>- Just remember it's an HT, not a mobile. They generally have intermod
>problems when attached to a decent antenna.

So true. The HT is designed for foot mobile operation. It is not a
good substitute for a regular mobile or base rig, though it can
sometimes be pressed into such service. Bandpass cavities in the
external antenna feedline can help some by keeping the out of band
signals from reaching the radio.

Nothing in the same form factor, the factory duck is really pretty
good. However, Comet makes a <something>-55A that works well. It's
longer, and kind of floppy, but it does have "gain" over the factory
duck. A homenade version of the Tiger Tail counterpoise can be
useful too, and only costs a few cents to make.

>
>I was thinking about trying an external mic, but I have a sneaking
>suspicion that the noise is engine related (the car is new Civic).
>
>Any suggestions would be appreciated.

Easy way to tell, run off the radio's internal battery. If the
noise goes away, it's the car. If the noise doesn't go away,
it isn't the car, not for transmitted noise. A remote possibility
is static, corona, discharge from the magmount getting back into
the radio's speech circuits. That would stop when you stop moving,
but you should hear it in receive too. A through hole mount antenna
will cure that. More likely is that the radio's mike gain or deviation
is too high, and it really *is* road noise being picked up. If people
are constantly telling you to back off the mike, that's the most likely
clue. You want the gain set so you need to close talk the mike and
speak up in a clear voice to have normal sounding audio. If you normally
speak softly, or hold the mike well away from your mouth, this may be
the problem.

You could ask him to tell you who he stole it from, I'm sure they could fill you in on the particulars. It's FM, crystal controlled, low power. Unless it's already full of crystals you can use, don't pay more than $10. And get a receipt in case the police come snooping around.

> Lots of folks put down
>the R.S. H.T.s because they won't receive/transmit out of the ham
>bands. I have a scanner to listen out of band, and I'm not licensed
>to transmit out of the ham bands. Go for it.

I for one wish that MORE VHF /UHF tranceivers wouldn't go out of band. As much fun as they are, my own personal experiance with Kenwood, Icom, and Alinco is that the front ends, if there are any ,are broad as a barn door. I have tried 3 different radios on from my fixed / home location, and every one of them gets wiped out. Useless as tits on a bull. Front end overload. A ham band only tranceiver would at least have the possibility of having some kind of front end selectivity. Granted, a radio made for mobile operation can't be expected to perform as well as or be as selective as a "base" style radio, but they sure could be alot better. The only radio I have that works while hooked up to an outside gain antenna is a 20+ year old ICOM IC-230 which has helical resonators in the front end. Unfortunately, it does'nt do the 145 sub-band, and does not have any built in CTCSS tones. My only other option for a 2 Meter radio, if I ever really feel the need, is an old GE MASTR II with an outboard synthesizer. Yech.

Many questions have been posted about out of band mods for this radio or that radio, and my favorite response, and one that I agree wholeheartedly with, is the "Tape a scanner to the back side of your radio" type of reply.

BTW, how many of you guys have a single or dual band radio with the out of band mods done, (rx AND tx) have accidently transmitted someplace you really shouldn't be? Hmmmm. Just curious.

1692. Tone squelch Alinco DJ580T

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-08 00:00:00 UTC
From: ga19989@evax01.d51.lilly.com
Message-ID: <1995Sep8.074913.1@evax01.d51.lilly.com>
Source record: 212780

I have an Alinco 580T handheld, 2m/440... nice HT, display a little small for old eyes... so maybe I am missing something... BUT

The tone squelch works nice, as our 443 repeater sends a subaudible tone so we can lock out the intermod and repeater I.D.... great... except the tone squelch of the 580T delays about 2 seconds before it opens up, and I miss the first 2 seconds of the other guy's transmission... any software fixes for this?

The other problem with the tone squelch is that it only works when I am monitoring that band (i.e. the 443 tone squelch is diabled when the radio's 2 meter transmitter is enabled)... any proven remedies to keep the tone squelch enabled when I am using the opposite band?

These are minor problems, so if no replies I will not sell the radio... it has been great otherwise (excpet my dog has found a way to erase everything in its memory.... twice! :)

Good hamming

Mel KJ9C

Most Scouts I have QSOed on cw have this problem. Also, voltage
regulation is quite critical as they tend to drift with the voltage.
While visiting Ten Tec last year, I asked the engineer about this and
they said " what do you expect from a low cost rig"?
Some do it worse than others for some unknown reason.
I would consider a pre-owned IC-735. Compare that to the cost of a fully
coiled Scout.

There is life on 900 Mhz, but I doubt if you will find any commercial gear to get on that band.

Most of the activity 0n 902 Mhz. is USB operated by the VHF / UHF buffs. The only way I'm aware of to get on that band is to use a transverter and a 2M all-mode as the i.f. rig.

Down East Microwave sells 902 transverter kits which are very simple to assemble and get on the air. There are also 902 loop yagi antennas available for that band.

I work 6 thru 2304, and I think you will find 902 to be the least populated of all the VHF / UHF bands, but there is good activity there during contests and good tropo openings.

1697. 4-SALE or Trade: SWAN-500 HF Transceiver

I have a SWAN-500 HF Transceiver with AC power supply for sale or preferably trade for a 20amp 12VDC Astron power supply. Make offer.

The transceiver is in very good shape, however, it may need a little attention, it has not been turned on for a couple of years. The radio would work good for someone who already has a SWAN-500 and use it for parts.

Thanks, please direct e-mail me if you would like to respond.

SE>Tom. Get one of those Radio Shack jobs. They are cheap and work fine. I
SE>have one here. I saw one posted for $150 on the swapnet.

I have one of those too and agree. The Radio Shack 2 meter and 440 are
both giving me good service. A friend of mine said he was having
trouble with his on packet, however, mine works great on packet.

I also have an FT-530 Yeasu which I will recommend even though it is
higher priced. It is dual band, is modifiable for aircraft band.
With the right antenna (I use the diamond RH77CA) and battery pack (I
use a look-a-like 12 volt for high power operation; also a 7.2 volt 1.5
amp hour for very low power, long time operation) You really get the
best of all worlds. It is about ...uh... $425 ? You'd better check
that I can't quite remember, I have had mine for a while now.

So can a pencil, a rock, a 2x4, a 12" Woofer,
etc....
or you can choke on a Nerf football I suppose.

Good point. It's a simple concept, but one that escapes many. The whole concept of personal responsibilty is totally foreign to so many people in the 90's. The whole firearms debate a good example. This is neither the time or the place to discuss firearms, and I will not, but it serves as a good example. Too many people see a little, insignificant non-problem, and immediatly start whining to their legislators (or the ARRL) and newspapers declaring a problem a "crisis" that needs immidiate attention. Lawmakers all to eager to find a vote, jump in, write a new law or two, get some free TV coverage, and declare it solved. What's even scarrier, we believe it! How about the ECPA of 1984? Or the ban on amplifiers capable of opeation between 26 and 30 MHz. If an example of extreme stupidity is required, how about the 55 MPH speed limit? Would anybody really trust congress with writing a law as to who and who shall not be able to purchase Amateur Radio equipment? Or worse yet, the Executive branch to issue an Executive order? Not that the executive branch has the time or the interest, they have neither, but on a slow news day, who knows?

I for one am quite willing to put up with a little intentional or malicious interference from an unlicensed operator rather than to have even more of my few remaining rights disolved by yet another stupid, poorly conceived, poorly implemented, poorly written law, to solve a problem that doesn't exist. I am quite sure that anybody who has spent any time on the radio has probably been the recipiant of malicious / intentional interference from many more licensed operators than unlicensed.

A store owner may now decide on his or her own, without the rule of law, not to sell amateur equipment to an unlicensed individual. Whatever path he or she chooses, is allright with me, great, I honestly don't care. Sadly though, the store owner will in all probabilty end up in court on some kind of a make believe discrimination charge, because the law doesn't "specifically prohibit" the selling of Amateur Radio equipment to unlicensed individuals. Aren't the 90's great? So what's it going to be?

More bad laws, or personal freedoms? I'll take the latter, with the associated risks and pitfalls that come with it, thankyou.

Good points all around. A good dual-bander is the IC-W21AT from Icom, but it's a couple of years old now and their newer models (which I haven't researched since I'm not looking to buy right now) might be even better.

2M and 440, true dual band, listen to ANY two frequencies at the same time (VHF/UHF, V/V, U/U), 35 memories per band, very good scanning/searching ability, and a nice small size. Only problem is that some people can't work the small buttons (I don't find them a problem). Large display shows you both frequencies at once; separate volume/squelch controls for each band; can output separate bands to external speaker and internal one at the same time, many other nice features.

I have a Web page with some additional info for the W21AT, V21AT and X21AT (I have the latter two).

Source record: 212655
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I may not be of any help to you on the FT-736R infor, but I have a FT-990 and it has 2 different "data" ports on the rear of the radio. One is for rtty and the other is for packet. The packet port is a 5 pin din plug. I use this port for all the digital communications. When I press the PKT button on the front panel, it selects the LSB as well. This port is active at all times, it also disables the mic port. I talked to the Yaesu reps at a local hamfest and they said this would work fine.

I may not have understood your inquery fully, however when you hook the TNC to the FT-736R just try to put the rig in the FM mode instead of the pkt.

Hope this info will help.

If you want to reply to me the my e-mail address is jivey@companet.net. I just happen to notice that i was connected on my daughters address.

>d010421c@dcfreenet.seflin.lib.fl.us

Sorry that ASCII gives such a lousy way to answer, but I'm going to
have to do it with words instead of pictures -- so stand by for
thousands of words!!

Terminate both the TV and the CD player with what they "want" to see
in the way of load resistance with a real resistor. Then run two
resistors from these loaded outputs in a "Y" and into the preamp. The
values of these resistors should be the value of the input impedance
of the preamp or lower so you don't lose a lot of signal. Most
preamps are designed with 10K and above input impedances. If you
can't find the input impedance in the specs, just take one of the
sources and put resistors in series with the input until you can
"just" hear a decrease in loudness. This is 6 dB, or so close to it
you won't care. This value is the input impedance of the preamp.

Sorry it took so much bandwidth to do what 5 schematic symbols would
have done, but oh, well...

>Jack WB3U

Right on Brother Jack,

We all have opinions, and they are all worth what we charge for them.
Allow me to contribute another priceless (or is it valueless) personal
non-expert opinion to this big pile of opinions.

If the dealer refuses to sell something because he thinks it will be used
illegally, more power to him. I seriously doubt that any Judge or jury
could find him at fault for attempting to avoid providing equipment used
to commit a crime. In my opinion, if the dealer knows or suspects the
radio stuff is going to used illegally and he sells it...then in my eyes
he's a piece of dog s...(oops) scum.

But then who knows in this crazy world? It ain't over til the fat lady
sues (used to be "sings").

People need to quit whining so much about rights. If we receive any more
protection for our rights we won't have any rights left. That's why I'm
voting the Ted Kennedy-Don King ticket. Preferential treatment must be
stopped. We need to improved moral fiber in our leaders.

Hello!

I am a collector of old transistor and tube type radios. Primarily interested in Japanese shirt pocket transistors from late 1950's to early 1960's. Also interested in older tube sets from 1920's to 1940's. Please let me know if you have any you want to
sell, I pay well for the radios I buy.

Thanks,

Ramair4@delphi.com

My only beef is the rudimentary PL tone board available. If you need to
get into more than one 6m repeater , pray that they use the same PL tone.

The tone board option is programmed by soldering jumpers !

Not something you can exactly do on the fly !

>
> Is a multi mode 6M rig worth the expense(when I don't have an HF rig
>that will take a 6M model) or do most just work FM?
>Do most just work simplex, or work repeaters?

The 6 meter operation mix is similar to what you find on 10 meters. Lots of SSB, some CW, and a good bit of FM repeating. An all-mode is worthwhile. The band is open less often than 10 meters, but when it is, it's almost as good. There's also some radio control activity for models on 6 that's missing from 10 meters, and 6 excells for meteor scatter operation since the required electron density almost perfectly matches what's available from typical meteor trails.

>Do operaters on 6M have problems causing interference on the TV
>frequencies?(I've heard that used to be a problem)

Yes, it still is, even with cable. Low power operation annoys the fewest neighbors. Mobile operation typically annoys more people, but for shorter periods, and they're less likely to know who you are and where you live, so the chance of revenge is less.

>Why do many 6M Rigs only operate on 10 watts?

It's the power limit for Class B Japanese licensees. The US demand for 6 meter equipment isn't large enough for most Japanese companies to produce a separate higher powered rig. Though there is a trend toward the 100 watt class in multimodes, at a premium price, and in rigs that include 6 meters with HF coverage where the same PA module can be used with only a tuned circuit change.

As an aside, logic dictates that there are only 3 worthwhile amateur power levels, 10 watts, 100 watts, and 1000 watts, though some would argue for 1 watt to be included for HTs. Each is a 10 db step from the other, and that's the smallest really noticable change in power. Of course there are those who struggle for every femtowatt differential, but it's usually a waste of effort. (Not always, of course, there are marginal situations where a small power increment makes the difference, but they're more exceptions than rules, especially when skywave propagation is involved.) Some would argue for 5 watts, 50 watts, and 500 watts as the steps instead, and I wouldn't disagree.

>on 12 V. it is on a mobile 5/8 antenna.

Ah, this is the "ERR 2" problem, right? It's caused by RF feedback.
Use of a properly thru-hole mounted mobile antenna, properly matched,
will eliminate this. High supply voltage (equates to high output
power) with the rubber dummy load can also cause an ERR 2 condition.
The VCO is being driven out of lock by the RF feedback. Resetting
the radio will recover from this condition without resort to the
service center. (Better VCO shielding, or smarter firmware recovery,
would avoid this annoyance, but no radio is perfect.)

>It is reported that the HTX-202 is very good in a high RF environment. It
>tends to not suffer from intermod interference. This might be something
>to consider, too.

This is the outstanding feature of the unit. The HTX-202 is simply
the best current production amateur HT in this regard. The 202 is
not as nice as many other HTs on the market in most respects, but
the freedom from intermod can make it the best choice for many
urban hams.

(I have no axe to grind, I'm using a different brand myself because
I need dual band capability, but this is a good radio and I wish
my dualbander were as free from intermod.)

>I'm thinking about getting the C508A for its size and low power demand, but
>I'm worried about not having autopatch capabilities. Please give me your
>opinion of this radio. Universal Radio has them back ordered. Thanks.

I like mine, but then I don't have a patch on my repeater, and I do
have a cellphone. I'm surprised by how well this little radio works.
Battery life is great. Intermod is much less than I had expected,
though there is some. Audio quality is good, both transmit and
receive, though receive volume is limited and might be a problem
in very noisy areas. The manual sucks, I mean *really* sucks (and
is insulting to a ham with an IQ above plant life too), but you can
figure it out if you try. There is no schematic or board layout or
theory of operation section, major bummer.

It takes Icom/Yaesu/Radio Shack/MFJ speaker mikes (and packet cables),
and I suppose you might find a mike with a TT pad on it (kind of silly
really, to have a mike bigger than the radio). The supplied rubber dummy
load is pretty good in the ham bands, but sucks rocks outside the bands,
a major bummer considering the wideband capabilities of the rig as a
scanner substitute (but likely a major contributor to the good intermod
performance in band). Comet has introduced a gain antenna for the rig
that works much better out of band. Big though. The rig has a SMA antenna
connector which limits antenna choice, and I wouldn't recomend swapping
it back and forth to a mobile antenna since the little connector would
wear out quickly.

The low output power surprisingly isn't a problem. It gets in almost
anywhere my FT470 does, both used as handhelds and not as mobile rig
substitutes.

All in all, a good buy for what it is (I don't expect it to substitute
for a mobile rig, and it makes a great "remote mike" for a crossband
capable mobile rig). I'm keeping mine.

What about public schools, public hospitals, public armed forces,
public police, public construction departments, etc. etc. Last I
heard, the Gross National Product now consists of publicly-funded
services as a *majority*.

<<snip>>

>I have often felt that in many ways America is at both extremes like
>kids at extreme opposite ends of a seesaw. What is needed is for
>both to come closer to the middle.

There is no viable middle. One extreme is unbridled government
control without regard for individual rights, the other is the
absolute protection of those rights. Despite efforts to confuse these
issues, I know which is the preferable state.

I also have a Radio Shack 144/430 SWR PWR meter, but there's no
"%" on it that I can find. The meter is Cat no 19-320, BTW.
I wish somebody could make me understand the "SWR correction
curves on the back. They are there to correct meter error at
certain low power levels, but I'm just too dense to use them.

>don't want to buy something that's going to be generating a lot of noise
>on HF. Any feedback is greatly appreciated!
>73's Mike KS4DA

That's an old boat anchor machine. It's not particularly quiet,
but can be made so with sufficient shielding effort. In general,
modern motherboards are quieter than older ones because they
use multilayer construction with internal ground planes, and
because they use lower power parts. The case on that old machine
is pretty solid compared to some of the mostly plastic new ones,
however, and you can apply standard shielding techniques to
contain the noise inside the case.

Most of the noise that will bother you on HF, however, typically
comes from the monitor. The latest "green" monitors are usually
quieter than older monitors. And color monitors are somewhat
easier to shield than monochrome monitors.

It's difficult to make recomendations by model on which computers
are quiet and which aren't. There's too much variation in the
details of assembly that matter most. Two computers by the same
manufacturer, built on the same day, can have widely different
noise output. A lot depends on the "bite" of the screws holding
the case together. Good shielding practice requires a solid
electrical connection along all seams. For painted cabinets with
few screws, that's really iffy. If you sand the paint off of
mating surfaces, and use a screw every two inches along the
seams, most any computer can be made quiet. Of course external
cables can radiate like mad. You need to use shielded cables,
with connectors with shielded hoods, and a ferrite bead or
two won't hurt either.

One thing that likely *won't* help is "grounding" the computer.
That just supplies another conductive path along which the
noise can radiate, and can create ground loops that make the
noise worse, though sometimes you can "short out" an existing
ground loop by using a direct ground connection. (There's nothing
magic about ground that sucks noise away.)

The UCC (Uniform Commercial Code) is adopted by most States. It
requires that if you open your doors to the public, you can't
discriminate in who you sell to, with certain exceptions, IE
you can't sell firearms or booze to minors for example because
they aren't legally eligble to buy them. There's no such legal
restriction against sales of radio equipment to unlicensed
individuals. Restricting sales to amateurs only is equivalent
to limiting service in a resturant to whites only. Posting a
sign doesn't make it legal. Of course the outcome of individual
cases depends on the competence of the lawyers and judges
involved, and the depth of the pockets of the litigants.

Yes they did, it was called Class A CB, and operated at UHF.
That's now called GMRS and is no longer called CB, but repeaters
are still allowed. Repeaters aren't, and never have been, allowed
for Class D CB. Classes B and C CB were for remote control, and
have been largely subsumed under other Parts now, but at least
at one time Class D wasn't the only CB service.

>like excercising for cardiovascular fitness. . . .

One of the problems with analogies is that their logic, while
persuasive, is often unrelated to the principles under discussion.
The above attempts to convince one of the merits of comparing sentient
individuals to body parts. I've heard similar analogies relating us
to ant colonies and bee hives. Buzz me up, Scotty.

>Freedom is defined in many ways.

Freedom is defined in only one way - the recognition, respect, and
protection of the rights of each individual.

>A self governing people generally express themselves through the
>vote.

There is no direct correlation between freedom and democracy. One has
to ignore many inconsistencies and unfounded assertions to believe
otherwise.

>But a grave mistake is made when back roads created by wealth begin
>thwarting the political process.

Those back roads are the result of a political system already
corrupted and insufficiently restrained by an inadequate Constitution.
The more it's thwarted, the greater the chance for majority
recognition of this fact. Have at it, guys.

>>The vendor owns the equipment and ** it is his property to do with
>>as he pleases. **

>By your same logic then it is morally sound to sell to unliscensed
>persons. (I added the stars in case you missed the point.)

I didn't say it was immoral to sell to unlicensed persons, although in
fact it doesn't meet the standards I would set for myself in that
position. The only immorality I've seen mentioned is the suggestion
that dealers should be forced by law to sell to everyone. This
concept is just as immoral as a law *prohibiting* them from selling to
everyone. Comprende mi amigo?

While I agree in general with what you have stated above, I feel that you will find that the IBM AT computer will be very quiet on HF for you. I have had one of the IBM AT's and it along with the NEC 1401 EGA monitor, never bothered my HF equipment (Kenwood 830s and Yaesu 757).

The IBM 286 computer system is a finely crafted computer in a case that is electrically shielded and very quiet. I wish I still had the computer. I think that if I were you however, I'd consider getting the computer but yanking out the IBM motherboard and replacing it with one of the new 486 or pentium motherboards and components.

Yep, wish I still had that machine.

WB>What about public schools, public hospitals, public armed forces,
WB>public police, public construction departments, etc. etc. Last I
WB>heard, the Gross National Product now consists of publicly-funded
WB>services as a *majority*.

There are so many catagories of needs that you have not even scratched
the surface. They couldn't come close to addressing the need. In many
catagories, there is NO public answer what so ever.

WB> <<snip>>

I don't understand what "snip" means.

WB>>I have often felt that in many ways America is at both extremes like
WB>>kids at extreme opposite ends of a seesaw. What is needed is for
WB>>both to come closer to the middle.
WB>There is no viable middle. One extreme is unbridled government
WB>control without regard for individual rights, the other is the
WB>absolute protection of those rights. Despite efforts to confuse
WB>these issues, I know which is the preferable state.

Ridiculous, of course there is. There might not be an "acceptable"
middle for you though.

That's pretty d*** funny!

>People need to quit whining so much about rights. If we receive any
>more protection for our rights we won't have any rights left.

The problem is, the government has failed to define what our basic individual rights are. Instead, it has allowed special interests to confuse their wants, desires and needs with legitimate rights. Satisfying the bogus "rights" of each whining "victim" now comes at the expense of everyone else's freedoms.

>I'm voting the Ted Kennedy-Don King ticket. Preferential treatment
>must be stopped.

Yes, no more preferential treatment. To each according to his needs! From each according to his abilities! Get with the program!

steve.sims@totrbbs.radio.org (Steve Sims) wrote:

>The anology WAS related. You can screw up by not taking a look at
>the whole picture now and then.

It's one thing to look at it, another to use it as justification to abrograte individual rights. Society is only a concept. It doesn't think, feel, invent machines or create wealth. Only you and I as individuals can do that. It follows that only individuals have rights, and that dismissal of those rights cannot ever actually be "good for society".

>WB>>Freedom is defined in many ways.
>WB>Freedom is defined in only one way - the recognition, respect, and
>WB>protection of the rights of each individual.

>Your knowledge and thoughts seem to come from only one place.

I spent more than ten years studying these issues because I could no longer reconcile the doctrine of our government with the freedoms it supposedly champions. The conclusions I reached have become the core of a strict moral philosophy.

>All I can say here is that freedom IS defined in many ways, you are
>wrong. (Unless you restrict your world to only those individuals who
>line up on fringe right.)

I don't know about the fringe right, but other definitions of freedom can only be accepted if you're willing to empower the government at the expense of individual rights. Given that individual rights are logically a prerequisite to freedom, those other definitions are logically false.

>WB>>A self governing people generally express themselves through the

>don't consider free at all. What right do we have to excessive
>pride?

Not much. I got a good laugh a few years ago when some politician applauded "the fall of socialism". He obviously knew that socialism isn't freedom, but in his ignorance he couldn't recognize either. The

USSR just happened to have it spelled out within the name of their country. <g>

>We are taught all the time not to talk about politics, because it >only ends up in hurt feelings. I guess that might be good advice >until we are able to talk without too much of a flareup. (At least >ones that incites riots and other unwarrented violent acts.) Until >then, we all have a greater tendency to line up and accept whatever >we are handed (especially if it is the hand that is feeding us.)

The heck with hurt feelings. Anyone who thinks we're no better than ants in a colony is a danger to us all, particularly in a democracy. As for accepting what we're handed, the same was true in the USSR until economic devastation forced a change. I only wonder what will happen *here* when our reserve of commercial initiative and natural resources are both finally depleted.

>Hmm... upon rereading earlier phrases up the chain in this >discussion I am suprised that you are choosing to express in just >this way. It sure seemed to me that you felt differently a few >messages ago. However, the misunderstanding was probably all in my >mind I guess.

It's extremely difficult to convey the meaning of someone's position in a few paragraphs. Some folks don't even believe what they write, they just like to stir the pot. :)

SR>like comments on the various models currently on the market. Personal
SR>experience and/or rumors greatly appreciated. I've been looking at the Sony
SR>IPS760 because of the immediate bells&whistles reaction.

Scott,
I own and use a Garmin 55 AVD GPS. I like it a lot. The AVD in the
model # means it is there aviation model and has emergency database
lookup functions and so forth. I am a pilot and just about wouldn't fly
without it. I have it battery backed up with a 10 hour reserve (10
hours with the backlight and serial port turned on) so that I can use
the backlight at night without running down the batteries. The battery
is a quantum ham battery, btw.

It has lasted a few years now and still in new shape. The current
models offer still more functionality, though, and the model 55 is much
lower in price than what I paid for it. (From $1299 down to $699, I
think.) I have used it on ocassion for hiking too. I looked at the
Sony and Trimble and Megelland, and seems like one other. What do you
want to use it for ?

rst-engr@oro.net (Jim Weir) wrote:

>Most preamps are designed with 10K and above input impedances.

Yes, in fact many are 25-50K, but that's not the problem. The output impedance of players, tuners etc. is usually 1K and less, sometimes only a few hundred ohms.

The risk with the Y connector is that the signal from one will get into the output stages of the other (even when it's off), causing distortion. The advice regarding the levels is true enough, but this won't determine the point at which any distortion generated this way is reasonable.

If the distortion is below the threshold this particular person can detect, maybe it doesn't matter. I just wouldn't recommend it as a method of driving the preamp without this one additional caveat.

I am looking for a model of tranceiver that could allow me :

- to use in a first time terrestrial packet network (AFSK)
- to be a start point for a later satellite station

WHAT TYPE OF TRANSCEIVER DO YOU ADVISE ME ?

I am about to buy a second hand IC 245E, have you info about it ? (I only know that it is an old all-mode 2m TX, with 10W power). Would it be a good choice ?

(As a student and new OM, I am looking for a not too expensive solution.)

PLEASE HELP !!!

TNX ...

Source record: 212616

Hi,

Don't know if this is the right place to post this, but here goes.

I shall shortly be going to the US for a couple of years to work. At the moment I have a FM/AM audio/hi-fi tuner which works fine for UK radio stations. What I'm looking for is a portable multi-band receiver so I can get UK radio stations in the US - particularly BBC world service. I also need a portable radio for general use, so this may be the ideal time to kill two birds with one stone.

I don't want to spend a lot, nor do I need a super-dooper mega kit, a small reliable, portable receiver will do. My price range is up to about UKP150 ($230).

Thanx in advance.

Source record: 212617

I just returned from the Melbourne (FL) Hamfest, and had a great time. It's my favorite of all the Florida hamfests.

I brought home a nice antenna coupler, but have no manual or info. It's an RF 675 Antenna Coupler from RF Communications Inc. Does anyone have any info (or a manual) on this unit. It seems to be a roller inductor, split-stator type tuner. The inductor and capacitor each have a geared, 3 digit 'turns counter' indicator. Looks like it should take 200 watts or so. Any info would be greatly appreciated.

I for one wish that MORE VHF /UHF tranceivers wouldn't go out of band. As
much fun as they are, my own personal experiance with Kenwood, Icom, and
Alinco is that the front ends, if there are any ,are broad as a barn door.
I have tried 3 different radios on from my fixed / home location, and
every one of them gets wiped out. Useless as tits on a bull. Front end
overload. A ham band only tranceiver would at least have the possibility
of having some kind of front end selectivity. Granted, a radio made for
mobile operation can't be expected to perform as well as or be as
selective as a "base" style radio, but they sure could be alot better.
The only radio I have that works while hooked up to an outside gain
antenna is a 20+ year old ICOM IC-230 which has helical resonators in the
front end. Unfortunately, it does'nt do the 145 sub-band, and does not
have any built in CTCSS tones. My only other option for a 2 Meter radio,
if I ever really feel the need, is an old GE MASTR II with an outboard
synthesizer. Yech.

Many questions have been posted about out of band mods for this radio or
that radio, and my favorite response, and one that I agree wholeheartedly
with, is the "Tape a scanner to the back side of your radio" type of
reply.

BTW, how many of you guys have a single or dual band radio with the out of
band mods done, (rx AND tx) have accidently transmitted someplace you
really shouldn't be? Hmmmm. Just curious.

There is life on 900 Mhz, but I doubt if you will find any commercial gear
to get on that band.

Most of the activity 0n 902 Mhz. is USB operated by the VHF / UHF buffs.
The only way I'm aware of to get on that band is to use a transverter and
a 2M all-mode as the i.f. rig.

Down East Microwave sells 902 transverter kits which are very simple to
assemble and get on the air. There are also 902 loop yagi antennas
available for that band.

I work 6 thru 2304, and I think you will find 902 to be the least
populated of all the VHF / UHF bands, but there is good activity there
during contests and good tropo openings.

I remember someone saying a couple of posts back that they prefered some
Kenwood units over the RS one due to their shirt-pocket size. My question
is, how much transmit power do you give up by going this route, and how
thick of bloves must you wear while transmitting to avoid the heat <G>.

>
> Is a multi mode 6M rig worth the expense(when I don't have an HF rig
>that will take a 6M model) or do most just work FM?
>Do most just work simplex, or work repeaters?

The 6 meter operation mix is similar to what you find on 10 meters.
Lots of SSB, some CW, and a good bit of FM repeating. An all-mode
is worthwhile. The band is open less often than 10 meters, but when
it is, it's almost as good. There's also some radio control activity
for models on 6 that's missing from 10 meters, and 6 excells for
meteor scatter operation since the required electron density almost
perfectly matches what's available from typical meteor trails.

>Do operaters on 6M have problems causing interference on the TV
>frequencies?(I've heard that used to be a problem)

Yes, it still is, even with cable. Low power operation annoys the
fewest neighbors. Mobile operation typically annoys more people,
but for shorter periods, and they're less likely to know who you
are and where you live, so the chance of revenge is less.

>Why do many 6M Rigs only operate on 10 watts?

It's the power limit for Class B Japanese licensees. The US
demand for 6 meter equipment isn't large enough for most
Japanese companies to produce a separate higher powered rig.
Though there is a trend toward the 100 watt class in multimodes,
at a premium price, and in rigs that include 6 meters with HF
coverage where the same PA module can be used with only a tuned
circuit change.

As an aside, logic dictates that there are only 3 worthwhile
amateur power levels, 10 watts, 100 watts, and 1000 watts,
though some would argue for 1 watt to be included for HTs.
Each is a 10 db step from the other, and that's the smallest
really noticable change in power. Of course there are those
who struggle for every femtowatt differential, but it's usually
a waste of effort. (Not always, of course, there are marginal

situations where a small power increment makes the difference,
but they're more exceptions than rules, especially when skywave
propagation is involved.) Some would argue for 5 watts, 50 watts,
and 500 watts as the steps instead, and I wouldn't disagree.

>on 12 V. it is on a mobile 5/8 antenna.

Ah, this is the "ERR 2" problem, right? It's caused by RF feedback.
Use of a properly thru-hole mounted mobile antenna, properly matched,
will eliminate this. High supply voltage (equates to high output
power) with the rubber dummy load can also cause an ERR 2 condition.
The VCO is being driven out of lock by the RF feedback. Resetting
the radio will recover from this condition without resort to the
service center. (Better VCO shielding, or smarter firmware recovery,
would avoid this annoyance, but no radio is perfect.)

>It is reported that the HTX-202 is very good in a high RF environment. It
>tends to not suffer from intermod interference. This might be something
>to consider, too.

This is the outstanding feature of the unit. The HTX-202 is simply
the best current production amateur HT in this regard. The 202 is
not as nice as many other HTs on the market in most respects, but
the freedom from intermod can make it the best choice for many
urban hams.

(I have no axe to grind, I'm using a different brand myself because
I need dual band capability, but this is a good radio and I wish
my dualbander were as free from intermod.)

I also have a Radio Shack 144/430 SWR PWR meter, but there's no
"%" on it that I can find. The meter is Cat no 19-320, BTW.
I wish somebody could make me understand the "SWR correction
curves on the back. They are there to correct meter error at
certain low power levels, but I'm just too dense to use them.

I like mine, but then I don't have a patch on my repeater, and I do have a cellphone. I'm surprised by how well this little radio works. Battery life is great. Intermod is much less than I had expected, though there is some. Audio quality is good, both transmit and receive, though receive volume is limited and might be a problem in very noisy areas. The manual sucks, I mean *really* sucks (and is insulting to a ham with an IQ above plant life too), but you can figure it out if you try. There is no schematic or board layout or theory of operation section, major bummer.

It takes Icom/Yaesu/Radio Shack/MFJ speaker mikes (and packet cables), and I suppose you might find a mike with a TT pad on it (kind of silly really, to have a mike bigger than the radio). The supplied rubber dummy load is pretty good in the ham bands, but sucks rocks outside the bands, a major bummer considering the wideband capabilities of the rig as a scanner substitute (but likely a major contributor to the good intermod performance in band). Comet has introduced a gain antenna for the rig that works much better out of band. Big though. The rig has a SMA antenna connector which limits antenna choice, and I wouldn't recomend swapping it back and forth to a mobile antenna since the little connector would wear out quickly.

The low output power surprisingly isn't a problem. It gets in almost anywhere my FT470 does, both used as handhelds and not as mobile rig substitutes.

All in all, a good buy for what it is (I don't expect it to substitute for a mobile rig, and it makes a great "remote mike" for a crossband capable mobile rig). I'm keeping mine.

One of the problems with analogies is that their logic, while
persuasive, is often unrelated to the principles under discussion.
The above attempts to convince one of the merits of comparing sentient
individuals to body parts. I've heard similar analogies relating us
to ant colonies and bee hives. Buzz me up, Scotty.

>Freedom is defined in many ways.

Freedom is defined in only one way - the recognition, respect, and
protection of the rights of each individual.

>A self governing people generally express themselves through the
>vote.

There is no direct correlation between freedom and democracy. One has
to ignore many inconsistencies and unfounded assertions to believe
otherwise.

>But a grave mistake is made when back roads created by wealth begin
>thwarting the political process.

Those back roads are the result of a political system already
corrupted and insufficiently restrained by an inadequate Constitution.
The more it's thwarted, the greater the chance for majority
recognition of this fact. Have at it, guys.

>>The vendor owns the equipment and ** it is his property to do with
>>as he pleases. **

>By your same logic then it is morally sound to sell to unliscensed
>persons. (I added the stars in case you missed the point.)

I didn't say it was immoral to sell to unlicensed persons, although in fact it doesn't meet the standards I would set for myself in that position. The only immorality I've seen mentioned is the suggestion that dealers should be forced by law to sell to everyone. This concept is just as immoral as a law *prohibiting* them from selling to everyone. Comprende mi amigo?

There is no viable middle. One extreme is unbridled government
control without regard for individual rights, the other is the
absolute protection of those rights. Despite efforts to confuse these
issues, I know which is the preferable state.

>don't want to buy something that's going to be generating a lot of noise
>on HF. Any feedback is greatly appreciated!
>73's Mike KS4DA

That's an old boat anchor machine. It's not particularly quiet,
but can be made so with sufficient shielding effort. In general,
modern motherboards are quieter than older ones because they
use multilayer construction with internal ground planes, and
because they use lower power parts. The case on that old machine
is pretty solid compared to some of the mostly plastic new ones,
however, and you can apply standard shielding techniques to
contain the noise inside the case.

Most of the noise that will bother you on HF, however, typically
comes from the monitor. The latest "green" monitors are usually
quieter than older monitors. And color monitors are somewhat
easier to shield than monochrome monitors.

It's difficult to make recomendations by model on which computers
are quiet and which aren't. There's too much variation in the
details of assembly that matter most. Two computers by the same
manufacturer, built on the same day, can have widely different
noise output. A lot depends on the "bite" of the screws holding
the case together. Good shielding practice requires a solid
electrical connection along all seams. For painted cabinets with
few screws, that's really iffy. If you sand the paint off of
mating surfaces, and use a screw every two inches along the
seams, most any computer can be made quiet. Of course external
cables can radiate like mad. You need to use shielded cables,
with connectors with shielded hoods, and a ferrite bead or
two won't hurt either.

One thing that likely *won't* help is "grounding" the computer.
That just supplies another conductive path along which the
noise can radiate, and can create ground loops that make the
noise worse, though sometimes you can "short out" an existing
ground loop by using a direct ground connection. (There's nothing

magic about ground that sucks noise away.)

The UCC (Uniform Commercial Code) is adopted by most States. It
requires that if you open your doors to the public, you can't
discriminate in who you sell to, with certain exceptions, IE
you can't sell firearms or booze to minors for example because
they aren't legally eligble to buy them. There's no such legal
restriction against sales of radio equipment to unlicensed
individuals. Restricting sales to amateurs only is equivalent
to limiting service in a resturant to whites only. Posting a
sign doesn't make it legal. Of course the outcome of individual
cases depends on the competence of the lawyers and judges
involved, and the depth of the pockets of the litigants.

Yes they did, it was called Class A CB, and operated at UHF.
That's now called GMRS and is no longer called CB, but repeaters
are still allowed. Repeaters aren't, and never have been, allowed
for Class D CB. Classes B and C CB were for remote control, and
have been largely subsumed under other Parts now, but at least
at one time Class D wasn't the only CB service.

1779. Re: Scout Freq Compensation

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-10 00:00:00 UTC
From: bmitchel@kodaki.kodak.com
Message-ID: <42vh5p$j3v@kodak.rdcs.Kodak.COM>
Source record: 212638

To all who responded to this question. I appreciate your responses
for sure! I called Ten Tec regarding this issue. It seems that
the frequency compensation minimum quantization is much less than
100 Hz, and that it works as follows:

CW -10Hz to +40 HZ window around the operating freq.
SSB 100 HZ window around the poperating freq (+- 50 HZ)
anything outside that window is compensated for, in much smaller
increments than 100 Hz.

Thus those of you out there that have these rigs, congrats,
I'll probably start looking for one now that I know the real
story, and have had good feedback.

If any of you out there are parting with your scouts, give me a
shout. (716) 637-6872 before 10 PM EDT. or email bmitchel@kodak.com.

nice rig for 80/40, with an occaisional trip to 20?

That's a tough question, Jim. I've seen people spend twice the
commercial value to restore cars, radios, model trains, etc. etc.

If you consider the rig to be just an appliance, the answer is
probably no, depending on what it needs. Things get old, things
break. Replace the tubes today and the power transformer might burn
up tomorrow.

OTOH, if you enjoy the restoration process itself and appreciate the
fun of operating older rigs, maybe it's worth it. If you elect this
route, be prepared for an ongoing outlay of cash and time due to
decreased reliability and higher maintenance costs.

jdb99@ix.netcom.com (jdb) sed:

:>" WE DO NOT SELL AMATEUR RADIO EQUIPMENT CAPABLE OF TRANSMITTING
:> TO ANYONE WHO DOES NOT HAVE AN AMATEUR RADIO LICENSE."

You probably had a water fountain with a sign over it that said, "WHITES ONLY"
too.

Twenty years ago you may have gotten by with your sign but I doubt today that
it would stay up long.

I previously sed:
:>>FWIW, I sold at least three radios yesterday to unlicensed
:>>individuals.

jdb replied:
:> As was your right to do so. If they cause you grief with
:>interference please don't bother the FCC.

Here's where you lost me jdb. Why would I bother with the FCC in the first
place? They would be the last ones that I, personally, would contact. FWIW in
the last 15 years I have helped to squelch many an interfering station and
without help of the FCC. Well, except for one time, in 1983, when I had to
call the Powder Springs, GA monitoring station for assistance with fishing
boats in the Gulf of Mexico. Their modified 27 MHz transmitters were copied
very well on several 10 meter frequencies. But that is really unrelated to
what we are discussing here. I think Gary Coffman said it very well in his
most recent post.

I sincerely hope that your actions helped you to sleep better. I mean after
all, you were doing your civic duty and keeping people from becoming criminals,
right? I'm sure your actions helped to improve the sales figures of other
amateur radio dealerships. ;{D

Hmmmm....Four-Land. That says it in a nutshell.

Hey Burt! You can jump in anytime now. :-D

Cheers!

Dan Brown (danb@a.crl.com) wrote:

: 1. People say the best way to learn CW is to listen off the air.
: Well, that means you need a radio. Granted, receivers are available,
: but lots of people prefer the all-in-one convenience of a transceiver,
: which is why they're the most common type of rig. Why not let this
: person buy a rig to help learn code?

When I first was licensed I looked for a modern, already build transmitter
that I could use with my sw receviers. I had a Kenwood R5000, and an NRD535D.
I was unable to find anything that would work. In fact, I could not find a
new transmitter at all.

So as far as I can tell, there is no choice, unless you want to buy a
receiver and sell it when you get your license, you MUST buy a
transcevier.

Hi Gary,

They must have changed stuff since I was in the retail business. I never "paid" sales tax, I just collected it and passed it on to the state. So was never profit by avoiding sales tax unless I collected it and just kept it. If someone is charging customers tax and not turning it in they should go to jail!

OTOH you may mean the customer is breaking the law. It isn't illegal to buy out of state for any reason you desire (so far as I know) as long as it is a legal personal purchase and not part of a bootleg resale underground operation.

Are you implying there is a law that says we must purchase everything in the state where we live and mail order is illegal? Please explain.

The Garmin 45 is the value leader. It's a slick and tiny little box
that works very well, is gentle on batteries, and floats. Magellan
and Trimble offering are also good units. You don't want that Sony pig.
Every one I've tried had trouble acquiring and keeping the satellites,
much worse than even my antique Icom GPS which is also a battery gobbling
pig that demands an external amplified antenna to work in a car. You can
just throw the little Garmin up on the dash and it's a happy camper, I've
even seen it work while lying in the passenger seat.

Discount Marine, or one of the other marine chains, have the best
prices, and often have sales with even better prices. Last I looked
the Garmin 45 was $199, but I've seen it on sale for even less.

For sale posts belong in rec.radio.swap only. That is the charter of
the newsgroup. Buying, selling, and trading posts do NOT belong in any
other newsgroup in the rec.radio.amateur hierarchy.

This is all explained very nicely in the "Guide to the Personal Radio
Newsgroups," that Jay Maynard posts on the 15th of every month. One
begins to think maybe it should be posted daily. 8^{)

WB>One of the problems with analogies is that their logic, while
WB>persuasive, is often unrelated to the principles under discussion.
WB>The above attempts to convince one of the merits of comparing sentient
WB>individuals to body parts. I've heard similar analogies relating us
WB>to ant colonies and bee hives. Buzz me up, Scotty.

The anology WAS related. You can screw up by not taking a look at the
whole picture now and then.

WB>>Freedom is defined in many ways.
WB>Freedom is defined in only one way - the recognition, respect, and
WB>protection of the rights of each individual.

Your knowledge and thoughts seem to come from only one place. All I can
say here is that freedom IS defined in many ways, you are wrong.
(Unless you restrict your world to only those individuals who line up on
fringe right.)

WB>A self governing people generally express themselves through the
WB>vote.
WB>There is no direct correlation between freedom and democracy. One
WB>has to ignore many inconsistencies and unfounded assertions to
WB>believe otherwise.

Well, I agree (whew, finally). I agree with that. Yep. There are many
people who consider themselves free, who most of us living here don't
consider free at all. What right do we have to excessive pride ?

WB>>But a grave mistake is made when back roads created by wealth begin
WB>>thwarting the political process.
WB>Those back roads are the result of a political system already
WB>corrupted and insufficiently restrained by an inadequate
WB>constitution. The more it's thwarted, the greater the chance for
WB>majority recognition of this fact.

Yep, I agree with that too. The only thing that is lacking so far as
majority recognition goes is more forums such as this one to air out our
differences. This is great, isn't it ? Without good forum, ideas do
not pass from person to person much. We are taught all the time not to
talk about politics, because it only ends up in hurt feelings. I guess
that might be good advice until we are able to talk without too much of
a flareup. (At least ones that incites riots and other unwarrented
violent acts.) Until then, we all have a greater tendency to line up
and accept whatever we are handed (especially if it is the hand that is
feeding us.)

WB>>>The vendor owns the equipment and ** it is his property to do with
WB>>>as he pleases. **

WB>>By your same logic then it is morally sound to sell to unliscensed
WB>>persons. (I added the stars in case you missed the point.)

WB>I didn't say it was immoral to sell to unlicensed persons, although in
WB>fact it doesn't meet the standards I would set for myself in that
WB>position. The only immorality I've seen mentioned is the suggestion
WB>that dealers should be forced by law to sell to everyone. This
WB>concept is just as immoral as a law *prohibiting* them from selling to
WB>everyone.

Yeap, I certainly agree with that ! Hmm... upon rereading earlier
phrases up the chain in this discussion I am suprised that you are
choosing to express in just this way. It sure seemed to me that you
felt differently a few messages ago. However, the misunderstanding was
probably all in my mind I guess.

73 to you too, Jack.

I did a little research on the Scout/Argo frequency stability and setablility:

1) The operator's manual indicates that measurements to 10 Hz are used when compensating the LO (PTO+XTAL) frequency.

2) A frequency counter on the LO output (of an Argo) confirms that it is able to control within a 10 Hz range (or so) and that frequencies can be set each 10 Hz.

3) The bad news is that while the system is locked on a frequency it compensates for small changes in the PTO caused by the tuning control; it does not detect the operator input until a 100 Hz change (or so) was made.

So the answer is Yes and No. The rig locks well onto a give frequency, but one can have a devil of a time changing this control point by only a few Hertz.

: The FCC doesn't allow it.

In Australia we have a second "CB" service with 40 channels between
476.400 and 477.400 MHz, FM naturally.
Channels 1 to 10 and 31 to 40 are ten matched pairs for repeater use.
We don't have 27MHz repeaters either, too much potential for problems at
27 MHz... Plus the government policy for many years was to displace 27MHz
activity to UHF, though they seem to have accepted that 27MHz won't go
away now any more than it would in the 1970's when it wasn't yet legal
and was an amateur allocation.

>monitoring that band (i.e. the 443 tone squelch is diabled when the radio's
>2 meter transmitter is enabled)...

The DJ-580 tone squelch decoder is quirky in several respects:

1) When decoding a CTCSS tone, there is a 2 second delay from the time the received tone disappears until the decoder resets. Thus, when the CTCSS transmission "drops", the DJ-580 will be in carrier squelch mode for two seconds before reverting to CTCSS squelch mode. In some respects, this is not a bad thing. When operating simplex, for instance, it lets the user hear any non-CTCSS equipped stations attempting to break into the conversation between transmissions.

2) When there is a signal already present on the frequency without the proper CTCSS tone (such as a distant repeater) and a transmission with the proper tone appears on top of it, there will be a 2 second delay before the DJ-580 tone squelch opens up on the proper tone. This is what Mel is referring to above, and it definitely is a bug. Fortunately, the problem only occurs under the specific conditions described, but it is still annoying.

3) The tone decoder only functions on the primary band, so the secondary band will always be in carrier squelch mode. When swapping primary bands, however, the tone decoder applies the tone setting of the former primary band to the new primary band; and only updates the setting when a frequency or tone change is made, or the transmit button is pressed.

Example: You have 146.52 stored in VHF with a tone squelch setting of 100 Hz and 446.000 stored in UHF with a tone squelch setting of 88.5 Hz. While you are talking on UHF, the VHF side is in carrier squelch mode. When you push the VHF button (changing the primary band to VHF), the VHF side goes into tone squelch mode but with the UHF tone frequency of 88.5 Hz; rather than 100.0 Hz. It stays this way until you transmit or change receive frequency, at which point the tone frequency gets updated to 100.0 Hz.

My DJ-580 was one of the first units produced, so I don't know if any of these problems were addressed in later revisions.

1811. HTX-202 Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-10 00:00:00 UTC
From: VUBS79A@prodigy.com
Message-ID: <42v2hg$s98@usenetw1.news.prodigy.com>
Source record: 212694

Greetings,

I just bought my first 2-meter radio yesterday. Got the HTX-202 for $199 at Rat Shack. Signal reports have all been good and strong, with clear modulation. For $199, I figured I couldn't go wrong.

In the instruction manual, it says that the supplied 7.2V nicad pack should only be charged with the charger that's included in the package. It's rated at 12VDC, 1A. Would it hurt the battery pack and/or unit to charge from the 12VDC cigarette lighter cord? How about an external 12VDC, 2A power pack that I have?

My main concern is charging from the car cord. I want to make sure my nicad pack is fully charged at all times, but I don't want to mess up this nice little radio, either.

All,

I need some help, I was wondering if a Moto Mitrek could be used as a Ham repeater, I haven't heard of many, and so I was wondering. I know there are three different freq ranges and maybe more, (low cut, mid, and High-cut). So who can help me with this, one, just wondering? :)

Thanks a ton in advance,
Alan Adamson

I have just picked up a trio TH21-E handheld without any documentation

Does anyone Know this rig and if so could they let me know its output
also if there is anyway to run it from a 12V supply and anything else
that may be useful.

I intend to change its nasty phono style aerial socket at the first
oppurtunity anything I should watch out for?

many thanks

I've had a Ten-Tec Scout for almost 2 years and have had drift only for the first few minutes after it has been turned on. The rig has firmware that locks in the frequency. The drift has been impreceptable and I've not had a problem with it. Every rig I've owned has drifted a little bit. I think for the money its an excellent quality rig! However I am thinking of selling it and upgrading to a factory reconditioned Paragon only because I've outgrown the Scout and want the extra features of a more expensive hf radio.

CAH>anybodyy might have. If you can either respon here or e-mail me, I would
CAH>appreciate it. Thanks,

CAH>-Chris
CAH>-treefrog@winternet.com

Chris,
I can vouch for the fact that it is easy and fun to study and take the
test to get an amateur radio liscense. Since you have the desire to do
the things you mention (which in some cases are complex and require a
bit of study themselves). Getting the liscense is the easy part, and
just the start too. Once you've got that, you get easier access to a
lot of very knowledgable people that don't seem to mind spending a
little time here and there helping to pass on that knowledge. At this
point you'll probably find yourself with project after project.

CAH>Hi, I'm into launching model rockets, and need to come up with a very small
CAH>transmitter, and a matching receiver, to be used in locating rockets. It
CAH>doesn't have to be very powerful, say a 2500 ft range. The library wasn't t
CAH>helpful, but if anybody has plans, I would greatly appreciate it, or if you
CAH>could recommend another resource for plans, Thanks,

A friend of mine who was upgrading a remote control airplane to a higher
model sold me his old set at a great deal. I looked it over and
noticed a lot of small lightweight radio controlled servo motors and
stuff. And from the way he described it, there was a great variety of
equipment to choose from. Not that I know, but I'd bet that 1) either
something exists for model rockets, or 2) something could be adapted
from R/C airplane flying. Hmm.. Just a guess, if you can find a hobby
shop that sells remote control planes, you might stop by and ask about
model rockets. He might have them or know a magizine on that topic that
would provide information, or etc.

I have a few of those RT-68's and have fun using them just the way they are. Talk lightly and the nbfm'ers can hear you, or talk loud to another rt-68 and its the only thing that will hear you. you'll get used to limiting the audio. Any-way , thats how i use mine. Also have a few rt-67's and rt.70's. Want to convert the 70's to cw.

qrz.com has a large mods directory with text files, no schematics, that will help. Check ftp.qrz.com or www.qrz.com. Or buy the cd-rom if all else fails.

Message-ID: <42vven$q1p@news.genesis.net>
Source record: 212558

For sale, Swan 700-CX HF transceiver, in excellent condition
cosmetically on the inside and outside. Includes manual, matching
power supply and speaker. This is a good old high power vacuum tube
transceiver for 80, 40, 20, 15 and 10 meter ranges. 400 watts PEP.
I purchased the set two years ago at a sale and have used it quite a
bit for receiving only, performance is great for receiving but unknown
for transmitting.

Asking $175 or any reasonable offer, E-mail me at:

scotty@genesis.net

Hi there,

Does anybody have a copy of the CAP/MARS mods for the new Yeasu FT-8500 dual band mobile radio. If so I'd appreciate the info, either here or by email.

So far I love this radio despite it's rather clunky microphone/controller. Receiving range is wide on both bands, scanning speed is *fast* and intermod rejection seems good.

Even if you *don't* have the mods, I'd like to communicate with others who have this radio.

Thanks,

Bob

I think you've sussed it out. Thus far he has not been able to give away
his money and this means he is $40 ahead of budget and thus his enterprise
is a winner. Maybe I'll offer $100, take my company public on the success
of not paying it, and then make him a tender offer in stock :-)

1830. Selling to Unlicensed

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-11 00:00:00 UTC
From: steve.sims@totrbbs.radio.org
Message-ID: <12744.12.uupcb@totrbbs.radio.org>
Source record: 212566

I don't know why, but it seems that you previous message duplicated for some reason. In case my reply was lost for some reason, I'll resend it here.

WB>persuasive, is often unrelated to the principles under discussion.
WB>The above attempts to convince one of the merits of comparing sentient
WB>individuals to body parts. I've heard similar analogies relating us
WB>to ant colonies and bee hives. Buzz me up, Scotty.

The anology WAS related. You can screw up by not taking a look at the whole picture now and then.

WB>>Freedom is defined in many ways.
WB>Freedom is defined in only one way - the recognition, respect, and
WB>protection of the rights of each individual.

Your knowledge and thoughts seem to come from only one place. All I can say here is that freedom IS defined in many ways, you are wrong. (Unless you restrict your world to only those individuals who line up on fringe right.)

WB>A self governing people generally express themselves through the
WB>vote.
WB>There is no direct correlation between freedom and democracy. One
WB>has to ignore many inconsistencies and unfounded assertions to
WB>believe otherwise.

Well, I agree (whew, finally). I agree with that. Yep. There are many people who consider themselves free, who most of us living here don't consider free at all. What right do we have to excessive pride ?

WB>>But a grave mistake is made when back roads created by wealth begin
WB>>thwarting the political process.
WB>Those back roads are the result of a political system already
WB>corrupted and insufficiently restrained by an inadequate
WB>constitution. The more it's thwarted, the greater the chance for
WB>majority recognition of this fact.

Yep, I agree with that too. The only thing that is lacking so far as majority recognition goes is more forums such as this one to air out our differences. This is great, isn't it ? Without good forum, ideas do not pass from person to person much. We are taught all the time not to talk about politics, because it only ends up in hurt feelings. I guess that might be good advice until we are able to talk without too much of a flareup. (At least ones that incites riots and other unwarrented violent acts.) Until then, we all have a greater tendency to line up

and accept whatever we are handed (especially if it is the hand that is feeding us.)

WB>>>The vendor owns the equipment and ** it is his property to do with
WB>>>as he pleases. **

WB>>By your same logic then it is morally sound to sell to unliscensed
WB>>persons. (I added the stars in case you missed the point.)

WB>I didn't say it was immoral to sell to unlicensed persons, althoughin
WB>fact it doesn't meet the standards I would set for myself in that
WB>position. The only immorality I've seen mentioned is the suggestion
WB>that dealers should be forced by law to sell to everyone. This
WB>concept is just as immoral as a law *prohibiting* them from sellingto
WB>everyone.

Yeap, I certainly agree with that ! Hmm... upon rereading earlier phrases up the chain in this discussion I am suprised that you are choosing to express in just this way. It sure seemed to me that you felt differently a few messages ago. However, the misunderstanding was probably all in my mind I guess.

73 to you too, Jack.

In Kalifornia, if you purchase something via mail order from another
state and the retailer does not charge you Kalifornia sales tax, you
are supposed to send the state of Kalifornia a check (or money order,
precious metals, your first born child, other legal tender) for the
amount of the sales tax it WOULD have been had you purchased it in
Kalifornia (Long damn sentence, isn't it?). I am not aware of anyone
that actually does it though. . . .I do of course. I, of all people,
would NEVER break/bend/fold/spindle/mutilate any law of the state of
Kalifornia whether that law was just or unjust.

The Kalifornia State Board of Equalization actually has the b..ls to
ask mail-order retailers (who have no offices/stores in Kalifornia)in

other states to collect the sales tax for them. The retailer, however, is not obligated, legally (yet anyway) or otherwise, to comply. I understand most other states have the same type of law as Kalifornia.

So there. . .

Has anyone had any trouble with a Kenwood TS820S digital diplay? Mine is a little flaky at times, and reads 2KC high on 40 meters, and a couple of MC off on 20, 15, and 10.

Any suggestions, other than deep-sixing?

1833. Mods for Uniden 66 PCXl

Source record: 212569

Hi,
it looks to me as though you have the technical interest to perhaps do a ham test. You know, with the technician class license you can do a test very easily WITHOUT morse code. You answer about 55 questions and thats it!

The ARRL has a Video package that makes it very easy to learn which you can borrow from your library. For small time CBers like you (or for anyone with interest in the field), it is not very difficult and opens up new bands.

And you can remain a CBer if you like as well.

As far as mods are concerned, I dont have any, but if you get magazines such as Popular Comms and Monitoring times, info is provided about modifying your radios.

Good luck,

Peter, KC1QF
kc1qf@amsat.org

Hi Joe, Dont mean to sound like a jerk, but this
newsgroup is not intended for buying and selling gear.
Please dont cross-post to this newsgroup, when putting
up the buy/sell/swap adds. As the name implies, the
discussion on this newsgroup center around equipment
itself and not about the buying/selling for business.
Most of the readers on this newsgroup also read
rec.radio.swap, which is the appropriate newsgroup for
buying and selling amateur and commercial radio gear.

Also, please no caps. It infers "shouting", which
would tend to scare the customers off.

Congratulations on vending used ham gear...not many
outlets deal in used gear these days.

Seriously...not meant to be a flame. Just some
friendly information.

>Mike, I have the MFJ here and it works pretty well. It is about an s unit
>down from a full size antenna on 14 MHz, and nearly equal on 28 Mhz.
>Tom

Occasionally use one here from BV at the club station. The antenna is mounted horizontally at about 120 feet in the clear (away from any nearby metal). While tuning is very touchy (hard to tune), the performance is quite decent. We ran the All Asia CW contest with it and it it OUTPERFORMED the 1/2 wave vertical (R5) on 20 and 17, was equal on 15, 12, and 10. It is only about 1 s-unit below a 2-element tri-band trap yagi (Mosley TA-32). This one was brought back from Canada by a local ham..
BTW....I'm still trying to get my hands on one but no luck so far. I'd say give it a whirl if you can find one.

Exactly right. The retailer has no legal obligation to collect the tax,
since they are not doing business in the state of California. They can
"ask" all they want, but it usually doesn't accomplish much.

So...if you live in California...take the short drive to Oregon and make
all your purchases there. (Oregon has no sales tax)

>helpful, but if anybody has plans, I would greatly appreciate it, or if you
>could recommend another resource for plans, Thanks,

In a very old Popular Electronics magazine article (late 60s) there
was a project to build a 100 mW FM transmitter for rocket telemetry.
A kit was available. It transmitted under Part 15 in the FM broadcast
band. Range was plenty for Estes rocket kits. I built one, it worked.

So, it would seem that any little FM wireless broadcaster circuit
should work. The trick is in packaging it to fit the rocket tube.
A one chip transmitter, like the Motorola MC2833 used in cordless
phones, would seem ideal. Motorola has an Application Note on
building little FM transmitters with this chip. Ramsey also has a
little FM broadcaster kit, though the circuit board is shaped
wrong to fit in a rocket. Or you might try gutting a Mr. Microphone.
I suspect that circuit board would be just a fit.

I used several different sensors with my little transmitter.
I used a thermistor for temperature measurements, and a
phototransistor looking out one side of the rocket to give
me a spin count. Either could be hooked to the "mike" input
to vary the frequency of the transmitter according to the
conditions they were sensing. An ordinary FM radio was
used to receive the signal.

For use in RDFing a downed rocket, all you need is the carrier
signal, a handheld FM broadcast radio with an external antenna
input, and a directional antenna. A double ducky direction finder
would be nicer and they're simple to build, or kits are available
for about $25. (That uses two short antennas on a stick with a
switching circuit that switches one then the other antenna to
the receiver at an audio rate. You just turn the stick until
the audio note nulls in your receiver and the rocket will be
in the direction perpendicular to the stick.) Amateurs use
all sorts of RDF gear for "foxhunting". There's a regular
column in 73 Magazine, and there's a book out too. You might
check those out for ideas.

>understand most other states have the same type of law as Kalifornia.

A bill is annually introduced in Congress to *force* mail order companies to collect the appropriate sales tax for the State of the purchaser. So far it hasn't passed, but its only a matter of time. A bill has passed that says if a company does business in a State, it has to collect sales tax for sales to people of that State, even if the sale is mail ordered from another of the company's storefronts in another State. (HRO, AES, etc fall under this law for States in which they have a point of presence.)

There's a big fight about this annually. States with mailorder companies want them to pay sales tax to the State where the seller resides while other States want the money to go to the State where the purchaser lives. One or the other will win some day, and the era of dodging sales tax will be over for those who routinely punch the 800 numbers.

Hello:

I enjoy monitoring radio transmissions from public safety agencies, air-traffic and ham radio. I have a question about monitoring digital comunication. I have seen packet demonstrated using a PC. I am curious. Is this interface card able to inturpet most or all data transmissions? If not, does such a card exist? The reason I ask is that I would also enjoy monitoring Computer Aided Dispatching of police units, taxi services, paging companies, and other entities that use digital comunication.

Please e-mail any helpful responses. Thanks!!

I purchased used, an MFJ-422B keyer/paddle to use with my Kenwood ts-440s/at.
It doesn't work correctly when the "direct out" is connected to the 440s' key jack.
The "grid block out" jack doesn't work either *unless* I reverse the hot and ground leads.
Has anyone else experienced this? This same problem occured when this keyer was used with an Icom rig.

My question is: is it normal to have to reverse the keying lines, or is something wacky with the MFJ?

Thanks,
Bill Howell N5ALO

Our local RACES group (in formation) is going to be putting up a repeater shortly. This repeater will be on 220 MHz and, you guessed it, I have no equipment for 220, so I'd like to get an HT for the band. I really don't give a rip about having 50 gazillion memories or require something smaller than an Altoids box. I'd just like a reliable, inexpensive, fairly rugged HT for which batteries are (still) readily available.

Shoot, even an older 6-channel crystal-controlled job would do fine. What should I look for (new or used)?

> that may be useful.

This sounds like the Euro version (tone-burst) of the Trio/Kenwood TH21A. 12V lighter adapters were available. Also the quick charger included a 12V adapter. They both have a "dummy battery pack" that slides onto the radio that delivers 7.2V to rig. Output power is 2W/Hi, .2W/Lo. A no-frills handheld with a nice tight front end.

>
> I intend to change its nasty phono style aerial socket at the first
> oppurtunity anything I should watch out for?

Why don't you just pick up a male-phono to BNC adapter? It will fit snugly and work fine. Sure beats digging around in a radio that you may not be able to get replacement parts for. Kenwood sold a screw on BNC adapter for this (I have one), but I don't think it's still available. Call 'em and ask.

Legitimate question: I currently work for a company that has the need for rf sources to drive various goodies we make. Has nothing to with radios. Nothing. Say for example, a ham tranceiver, hf, vhf, what ever turns out to be a good, cheap rf source or driver. It's off the shelf, we can buy it, turn it on and use it. If it blow up, toss it. It's cheap. The other option is a signal generator (expensive) or oscillator, followed by a wide band, high gain distributed amplifier (even more expensive) of the Kalmus, ENI, or Amplifier Reseach variety. Would we be refused? I guess so under that policy. Granted, it doesn't happen often, but it happens. A lost sale is a lost sale. I remember one place I worked at MANY years ago had Drake 2NT's with 27.120 crystals (is that it, the ISM freq) scattered all over the joint used as cheap rf sources. Hardly illegal. Being a ham it made me cringe a bit, wish I had one. But not illegal.

Well I try to be expressive without being obscene. Communicting the point is important to me. Another variant of this would be to replace 'bull' with 'boar hog'. Works just as good. I have others, but not in a public forum such as this. I WILL end up insulting somebody which I don't care to do, for now.. Lets stay with the radio subject, and not veer to far off course here. I can do that very easily.

Bottom line, I guess for the bucks, the HTX 202 is a fairly decent radio.

Cheers.

From: tigger@jcomm.uoregon.edu
Message-ID: <430kao$off@maureen.teleport.com>
Source record: 212596

I am kind of embarassed to ask this question, but I own a TS-440S and I have never figured out how to turn down the RF output going to the antenna. There is an AF knob, which is the volume, and then there is an RF knob, which seems to only attenuate the RF coming into the set on recieve. Is it possible to turn down the RF output to do something in the range of QRP, or is it always at 100watts output?

Any help will be appreciated.

The Best PC would be one that meets FCC Class B Type Acceptance requirements. This would include the Monitor and printer as well. Try to find a low radiation monitor within the budget restraints.
It will also help to have the computing equipment on a different 120vac circuit if possible. Using RFI/EMI surge protected and filtered duplex or multiple outlet boxes is benefitial. More important is the removal of the TX/RX antenna from the immediate area of computer. Stay away from long wires with tuner located in the shack. Balanced feed antennas are less susceptable to local computer RFI.

Subject: CAT Control Center (CATCC) Press Release.
Date : 1995 - Mon. Sept. 11 10:25 Local/ Mon. Sept. 11 13:25 Zulu
From : Steve Hajducek, N2CKH

The Shareware/Trial version of CATCC, CATCCjr, is about to make its debut. On September 28, 1995 CATCCjr will be placed on the ByteWise BBS for downloading as CATCCjr1.ZIP through CATCCjr4.ZIP respectfully. It will also be uploaded to the ARRL BBS and other popular Amateur Radio BBS systems and FTP sites. After the files have successfully been transfered to all sites, a message listing all sites will be sent via e-mail.

The CATCCjr version is basically a stripped down beta version of the full commercial version. It is being made available to allow potential users of CATCC a method to sample some of the latest features and comment on the software prior to purchase.

CATCCjr is NOT a supported product, it is not a complete product, it is only a trial version. However, should it meet the users needs, it can be used forever without any registration. However, CATCCjr will remain the copyrighted property of N2CKH.

```
=====================================================================
| |
| Pricing for CATCC has been set at $49.95 U.S. (plus $10 U.S. |
| for the bound user's manual) plus 6% N.J. state sales tax (and |
| $7 U.S. shipping and handling within the U.S. and $15 all other |
| locations). All shipping within the U.S. will be by U.S. Priority |
| Mail. A tenative shipping date has been set for the first week of |
| November, 1995. Orders will be shipped in the order received, |
| payment in U.S. funds by U.S. bank check or U.S. Post Office |
| money orders. Cash will be accepted, however, cash orders are NOT |
| recommended, especially from overseas. |
| |
=====================================================================
```

CATCC is the application Amateur Radio has been waiting for. It provides FULL control as provided by the equipment manufacturer of your C.A.T. radio via the computer. With a headset/boom microphone and foot switch an operator can literally keep their hands on the keyboard/pointing device and work'em/log'em faster than ever. With the DX-Graph(tm), DX-Filters(tm), Band-Watch(tm), Accu-Rotor(tm), AutoMode(tm), AutoGrab(tm), DX-Calendar and DX-Sleuth(tm) your always on top of the action and you'll have the latest in logging, analysis and reporting.

MS-Windows based, written in Visual Basic, C and Visual dbase, the CAT Control Center is fully event driven. It supports eight serial ports for HF and VHF rigs, Packet TNC (DX-Cluster monitoring), 2nd TNC for RTTY, Pactor etc., MM-3 electronic keyer, Rotor control and other peripherals. Also supported are parallel printer ports (3) for voice keyers, antenna switch boxes and others.

Basic operation of CATCC/CATCCjr involves an H.F. C.A.T. transceiver and VHF Packet TNC monitor DX spots. As spots are recieved, they are displayed and made available for selection by the user. Audible spot announcements and various DX-Alerting sound effects are available, when the user via pointing device or keyboard selects a spot, the C.A.T. transceiver is place on the spots frequency (and optionally mode), the spots call is placed in the log window and depending on mode and option selected a 59 or 599 is placed in RST s/r log windows as well. When worked, the user clicks on log, and all information, including the actual information from the H.F. rig (VHF also depending on make and model of radio) is logged.

This description sounds simple, and it is. It sounds like the basic computer/tnc/radio scenario, and it is. But, CATCC has so much more going for it that to try and write any more here does not do the software justice. It must be seen and used to fully appreciate the CATCC user interface and software features. The CATCC_PR.ZIP file which is available for downloading from the Bytewise BBS and the ARRL BBS has additional information and .BMP files of captured actual screen displays that provide more of a feel for the actual software in operation.

Currently supported are Yaesu radios, with Kenwood support being integrated. Sample Kenwood control programs have been written as of this date, but not fully integrated into CATCC. Planned is support of ICOM, Ten-Tec, JRC and SGC radios as well.

The Shareware/Trial version of CATCC, the CATCCjr version, will have many of the features of the full commercial version, it is basically a stripped down beta version of the latest commercial version. The missing features will include full logging and award tracking, only a CT compatiable .RES files will be created. Also missing will be the full DX-Graph(tm) component, and DX-Sleuth(tm) and other features that will only be available in the registered version.

The registered version, CATCC, brings with it full logging and award tracking capability supporting DXCC, WAS, WAZ, IOTA, VUCC with excellent analysis, reporting and label printing capabilities, as well as the full DX-Graph(tm) and DX-Sleuth(tm) real-time analysis tools. Registration obviously entitles the registrant to product support via the Bytewise BBS and Internet e-mail. Also one FREE upgrade (postage and handling required), resonably priced upgrades in the future, the CATCC user Newsletter and full access to the Bytewise BBS.

It is planned to add new features, such as new hardware support regularly, and to improve and refine CATCC, with upgrades about every six months or so.

For additional information on CATCC call the Bytewise BBS at 1-908-363-2760 and download CATCC_PR.ZIP which has a demo of the Accu-Rotor(tm) program module and other example programs or send e-mail to info@bytewise.org

/s/ Steve Hajducek, N2CKH

Accu-Rotor, AutoGrab, AutoMode, Band-Watch, ByteWise, CATCC, CATCCjr, DX-Calendar, DX-Graph, DX-Alert Filters, DX-Sleuth are trademarks of N2CKH.

Source record: 212454

Hi Doug-

I think it's an excellent product!

I bought the first one that the local Radio Shack received, and I am really pleased with it. It is a real improvement in
measuring true PEP during SSB, compared to the peak detectors that are included with most antenna tuners and that sort of thing.
I like the autoranging, and the ability to manually select the range, to allow the unit to settle quicker by not having to
always autorange.... and I like the fact that you chose to use a separate sensor unit, so the sensor can be right where you
need it to be without making the indicator inconvenient.

My main suggestion for improvement (and I know we are not talking about a $500 instrument here <g>) would be a variable time
constant on the "hold" function of the peak mode. It would allow you to set if for, say 5 or 10 seconds, and be able to see
what the power level of "frequently occurring peaks" is, like the old definition we used to use in watching for overmods in
broadcasting, and then you could also shorten it up as it is now in order to see what's going on over a shorter time span. Not
a major factor, but a consideration.....

A "signal pickoff" would be nice as well, to see just exactly what the meter is seeing on an oscilloscope, as well. Both at RF
and the detected output as well. Now once again, I know that we are adding up in cost here pretty fast, but those are just
some suggestions for the Deluxe Model, when it comes out! <g>

But, I really like the meter, and turn it one every time I crank up the HF station, which is just about every night.

Say.....since you ARE one of the designers.....hmm....can you suggest an easy mod to increase the "hold" time???

Thank you and Radio Shack for being interested, Doug! Seems that so many products are designed, built, and sold by a
collaboration of the Marketing and Accounting departments these days! <g> So many times I think "...did anybody ever REALLY
try this thing out before they put `m on sale???" <g>

Tony,

What a wonderful post. It is most amazing that your "policeman"
skills allow you to judge the intent of my post without ever viewing
my web page.

My primary objective is to advance the art of signal processing
applied to weak signal processing. One way to motivate is to pit man
against machine. The human mind is currently able to extract
information from a weak Morse code signal better than the best
signal processing algorithms. I believe the weak signal challenge is
standing proof. I've enjoyed reading about the creative techniques
applied in an attempt to extract the call from the noise. Several
universities have taken the challenge as a class project.

My secondary objective is to introduce more hams to EME
operation. The new EME audio recordings on my web page are
intended to show the quality of signals received from medium and
small stations.

I have received hundreds of Email/Guestbook responses about
my "EME & Weak Signal Page". Yours is the first negative response.
I researched your 100+ posts in the various newsgroups during
the past 6 months to see if you had provided some measure of
technical or social contribution. I found just one bit of insight in
all those posts:

"I do agree that people should never use an inappropriate level of insult."

So in response, I'll leave you with your own reflective quote
about yourself:

"I regret to confess that I remain an unrecified fool."

Cheers de Mike, AF9Y

I have had some great success with a mobile Hustler setup. I have the resonators for 80, 40, 20,15, and 10 meters all going to the same custom built bushing that makes the whole antenna system look like a tetrahedron (kinda' like a pyramid shape).

I mounted the whole thing on a 60 inch Hustler mast to a ball that is connected to a large (3' x 3') square steel ground plane. I have this contraption on my balcony of my second floor apartment and so far I have had some good results. I have an MFJ tuner to work out the SWR and I tune up 40M 1:1 no problem. I have a 12 ga. solid core copper wire going down the inside of the gutter drain and pounded a grounding rod into the dirt below. The ground seems to work pretty well...MAKE SURE THERE IS NO GAS LINE, ETC UNDER THE PROPOSED GROUND ROD SITE!!!????!! :-)

I hope this is some help...Good Luck

>"WHITES ONLY" too.

Not hardly, since that is a social issue and has nothing
to do with the "PRIVILEDGE" you are granted to operate
a transmitter in the Amateur Radio Service once you obtain
a license from passing the required test elements.
I find it typical of those whose moral values are questionable
to always revert to the use of social issues as a comparison
when they have nothing to do with the question at hand.

>Twenty years ago you may have gotten by with your sign but I doubt
>today that it would stay up long.

Wrong again. Since my partner died less than a year ago.
Until I decided that I did not want to stay in the business
without him our operation was very profitable. Our posted policy
was supported by 99% of all the hams in our community as well
as those who visted and purchased via mail order from us.

>:> As was your right to do so. If they cause you grief with
>:>interference please don't bother the FCC.
>
>Here's where you lost me jdb. Why would I bother with the FCC in the
>first place?

Simple. Those who cannot or will not make a stand for what is
right are the first to seek help from "officals" when they
feel their "RIGHTS" are being violated.
The bottom line here is simple. Those who sell to unlicensed
individuals could care less about the possible result of their
decision to place a "PROFIT" before the "PRIVILEDGE" earned
by those who have worked hard to obtain it.
You could care less if one more signal is added to the noise level,
even if it is from an unlicensd individual you sold a rig to.

This is a classic problem. You need to take apart the shielded box that holds the frequency counter logic and resolder all the top-layer wires on the PCBs well. They used dual-layer PCBs without plated through holes, counting on conduction through IC and component pins. Don't even bother looking for the particular bad connections; resolder everything. If you miss one it will go bad later and you'll have to do it again. After resoldering from the top, look at the bottom (non-component side) solder and make sure none of the connections there have gone 'cold' from the initial factory job or heating at the top. Then reassemble the radio, making sure all the ground screws are in solidly, and you should get at least consistent, though still possibly 2 KHz off results. This error could be coming from the reference crystal oscillator (also inside the logic box, I believe) being mistuned as well as a bad connection or logic problem.

The question raised was related to commerical activity and not objectives ... A cursory examination of the homepage in question does in fact affirm that you are engaged in a commerical acitivity and therefore the $40.00 offer amounts to little more than advertising.

"Ad hominems most often arise immediately following the need to obfuscate ...". Marvin Gardens (1938)

Cheers

Eddie

The postings about European Radio in USA reminded me...

I was visiting "me brudder" in Newfoundland a few years ago
(well, about ten years ago... sigh!) and we happened to be
sitting in his old Ford Tempo in St. Johns (near Signal Hill
actually). We flicked on the AM radio and *easily* (on that
day) picked up AM/BC stations from Norway all the way down
the coast of Europe to Morroco. The 9kHz spacing was easy
to notice but (with the cheap Ford radio) not a big issue.

Dear Mike,

Don't get upset. It *is* a joke. I broke in laughter the minute I read
it. I consider it a very good joke. It has a serious sounding tone with
a totally hilarious message. Come on, does your business have a budget
to *give away* money? Still in doubt? Check his address. Brits have
a way of telling off beat (to American) jokes.

Cheer, 73

I recently purchased a used FT-350, everything works fine. But being used for about a year the Nicad battery(FNB25) is not charging all the way up to 7.2 volts. First charge only went up to 6.5 volts. If I do a few cycles of complete charge/discharges will the voltage capacity slowly increase back to 7.2 volts? Or is there no hope for reviving this Nicad that's probably been sitting around for a while?

I've also heard of some technique used on so called dead NICAD's to give them a jump start for a bit more life.....anybody know what that technique may be?

Does anyone know if some Dealers have an exchange program with dead NICAD batteries.....or possibly sell "refurbished" NICAD's?

thanks for your responses,

Dave

Bill-

Why not get an Icom 2AT. It's rugged, reliable, and the batteries are
very common (compatible with the Radio Shack HTX-202). Two things to
consider are (1) does the repeater require a PL tone? (if so, maybe the
IC-2AT will not work for you), (2) what HTs do you currently have (you
might want to get something that uses the same batteries so you can use
them for multiple radios.

Good luck.

technique used on so called dead NICAD's to give
>them a jump start for a bit more life...

I recently "zapped" some life back into some AA nicads which read 0.0 volts on a meter. I removed the case, to get to the individual cells, then connected the cells *one at a time* to my
12 volt battery charger **for one-half second** on each cell. they seem to be working ok now
(back to 1.2 volts).
The charger I used was pretty stout and put about 20 amps into the cell.
The cells got slightly warm from this abuse, and I suppose there is the possibility of a cell exploding if you overdo this technique.
be careful

Bill

MK>This is a classic problem. You need to take apart the shielded box that
>holds the frequency counter logic and resolder all the top-layer wires on
>the PCBs well. They used dual-layer PCBs without plated through holes

There is even a service memo to this effect! It even gives the "bench
time" required to resolder everything. In fact there are several
service memos about this display that deal with it's poor connectors
and solder work.

My TS-820 display works fine on all bands except 10 meters. When on 10m
it jumps around by 2 to 4kc, and on occasion will stabilize and sit
still! I never bothered to try to diagnose it since it isn't that
serious (and I don't use 10m much these days). On all other bands it's
rock solid and right on freq.

Back in June, just before field day, the display went nuts. It was
displaying random segments, numbers, blank digits, etc. As you turned
the VFO it would change. I just opened the top cover and tapped the
shielded box with the screwdriver handle. It (the problem) went away,
and didn't come back (yet).

Very few postings on the Atlas saga seem to appear here even
though there must be quite a few om's out there who are concerned
or interested.

I ordered an Atlas 310 - as it was called then in the initial DDS
version - in April 93 and received order confirmation #247. In
the course of time (some time ..) I received several explantory
letters on an apparent continuing redesign process plus two
letters to submit my final payment since my rig would ship on
xx.xx. I have ignored these as I'd like to see a rig reviewed
somewhere first.
I've noted the "now shipping" information has stopped to appear
in the CQ ads recently.

Who can shed some light on what's going on ?

1897. Kenwood uses false advertising?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-12 00:00:00 UTC
From: MUENZLERK@uthscsa.edu
Message-ID: <01HV71OLLGDE00BSIW@uthscsa.edu>
Source record: 212526

gary@ke4zv.atl.ga.us (Gary Coffman) WRITES:

- ...There's no such legal
-restriction against sales of radio equipment to unlicensed
-individuals.

Yes there is... It is legal for an Amateur Radio operator to use
and possess an external power amplifier that will operate between
22MHz and 30MHz. It is illegal for non-licensed individuals
to use or _POSSESS_ such a device. It is therefore illegal to
sell such a device to an unlicensed individual.
For all of you picky people, non-licensed means that the
person doesn't have a valid amateur radio or commercial
license for which the device is FCC type accepted.

- ...Restricting sales to amateurs only is equivalent
-to limiting service in a resturant to whites only.

No it isn't.
One might say that it is just like having a "men only"
restroom or "women only" healthclubs.
Sex discriminating.
Just as it is legal for business to give "senior citizen discounts."
Age discrimination.

These are legal but the analogy still doesn't hold.

-...Posting a
-sign doesn't make it legal. Of course the outcome of individual
-cases depends on the competence of the lawyers and judges
-involved, and the depth of the pockets of the litigants.

This is often true. The party with the deepest pockets almost
always wins regardless of who is right or who is wrong.
-
-Gary

By the way, what does all this have to do with false advertising?

Kevin, WB5RUE

>Oh, Well you seem to know the concept of this discussion group. I guess
>it must be available for downloading from the bbs somewhere. Which
>discussion group does it belong to instead ?

I agree with Steve! This is a group for the advancement of the
purchasing, selling, and other issues regarding the type of
"amateur.equipment". Maybe we need another group called
"rec.radio.amateur.d"?

Let me see if I understand both sides here:

This group is for anything regarding HAM equipment.

This debate (largely ignored by most) began with a statement regarding
selling equipment that "the use of" requires that a user/control operator
be licensed by the FCC to operate in some particular frequency which
has been assigned (allowed) the HAM community.

From there came discussions regarding the issues surrounding a non-
licensed person acquiring one of these pieces of equipment. I
did not read all the postings, but they seemed to involve both
those who will illegally use the equipment, and those who will be
purchasing the equipment with the final recepient being a license
holding person.

I guess this debate has migrated to something not involving the
equipment, more of characters, therefore no longer belongs here.
Where? I don't know. As I stated before in this message, maybe
we need a normal discussion group? Maybe this should go to the
"rec.radio.amateur.policy"?

ON THE OTHER HAND... I have been reading the posts occasionally,
because I do like reading a debate that is being handled with
care and respect for eachother. In most cases, this has been the case
here, although, as we are all people, there are others who must
abuse the language and other people simply because they are
having a "bad hair day". That part's sad. Not a good image to
people who are thinking about joining this mostly fun hobby.

I'm doing this from memory as I just put the box in the garage!

The stock FT-8500 comes with:

Fancy Microphone/Controller w/mounting bracket and sheet metal mounting
strip
CSCSS Encode (but not decode)
Mobile Mounting Bracket
Remotable face plate (but no remote extention kit)
Wide Band Receive on both bands
DC cord with fuses
Two spare fuses
English/Spanish User Manual

Now, if only someone would upload the mods to oak.oakland.edu...

The first one couldn't be used because of distortion ... the second had
the speaker connection shorted so that the moment you plugged it in
there was no audio available from anywhere and the third well I'm
waiting ... anyway they look like junk, operate like and belong with
the rest of the junk ...

From: cyamamot@kilroy.jpl.nasa.gov
Message-ID: <433h7p$d56@lo-fan.jpl.nasa.gov>
Source record: 212535

Greetings,

I'm in the process of selecting a hill-top amplifier for repeater use
and was wondering if I could solicit any comments from others who have
experience with TPL, VoCom, Henry Radio or any other manufacturer whom
you might have used. Repeater drive to the amplifier can be set up to
30 watts if necessary. This is a UHF system.

Henry Radio seems to have the most "watt-for-buck" ratio but then again,
I'm wary as to why TPL or VoCom cost twice as much as Henry for the same
output wattage.

I *believe* I've read in past Usenet articles some years back that it's
a waste of time using mobile amplifiers from Mirage or RF Concepts on a
hill-top for lack of reliability under continuous duty. Has anyone had
any luck using a mobile amplifier from Daiwa or Tokyo Hy-Power on a hill?

Your comments and input are appreciated. Thanks in advance!

The antenna in the HTX 202 seems to like redirecting the RF back to the set causing the PLL to unlock, thus giving the message "Err 2" and requiring the unit to be returned to Tandy for servicing. Is this something one can fix one's self or is it a constant problem with that model? I am thinking of what to do with it when the warranty expires.
Thanks

Bryan ---

For the Kenwood TH-22AT, with the standard 6V battery, the output is 3W max .Two reduced power settings are also available, down to less than a watt. (I can't remember the specs.) The optional 9V battery enables 5W output. Actually, you can now choose (and pay for) the battery of choice when you purchase the unit. As for heat, I have not had a problem. I use the 6V battery at 1.5W (or so) output and in our urban area, that is plenty of power to hit any of the major repeaters from most anywhere in the county. And I, personally, have not found "excessive intermod" to be a problem.

Bought a Butternut vertical after working a large number of hams using that antenna. This is the 4th vertical that I have owned over the years and it is without a doubt, the best vertical on the market. Mine is ground mounted without radials and works great. Good DX antenna when there are these things called sunspots.

What does ANY of this have to do with selling to a non-licensed
individual? If I remember correctly the original question was
whether or not it was legal to sell amateur radio equipment to
non-licensed individuals.
The LEGAL answer is: It depends on what the equipment is.
If it is an FCC type accepted (commercial) transceiver or transmitter
the answer is YES. If it is an external power amplifier that will

operate between 22MHz and 30 MHz the answer is NO. If it is a commercial rig that has been modified and is capable of operating on 11 meters the answer is NO.

Now, a business may choose not to sell to unlicensed individuals. There is _NO_ legal reason preventing it from doing so. Of course there are groups of people against whom a business cannot discriminate, we all know who they are. "People who do not hold an Amateur Radio license" is not one of these groups.
Perhaps the original debate should have been "is it wise....?"

Kevin, WB5RUE

Source record: 212550

WB>It's one thing to look at it, another to use it as justification to
WB>abrograte individual rights. Society is only a concept. It doesn't
WB>think, feel, invent machines or create wealth. Only you and I as
WB>individuals can do that. It follows that only individuals have
WB>rights, and that dismissal of those rights cannot ever actually be
WB>"good for society".

True, but disparity begets disparity when one ONLY focuses on individual rights, the powerful become ever more powerful, the unfortunate ever more unfortunate. True, the well off EARN their money, and DESERVE the credit they derive from their positions of power and admittedly some sweat. But the meanings of EARN and DESERVE also walk with time. The slope of the playing field is far from constant, and farther still from level. 'Abrogate' here is a rather strong word. 'Modify' would be much better. I do not feel that individual rights should be indiscriminately revoked. I simply believe in the justice in putting limits on the slope of the playing field. (Kind of like stops on a gimble or gyro.) An example, off-hand, may be the limitations on campaign contributions. (I'm sure you can think of others.)

WB>I spent more than ten years studying these issues because I could no
WB>longer reconcile the doctrine of our government with the freedoms
WB>it supposedly champions. The conclusions I reached have become the
WB>core of a strict moral philosophy.

I'm sorry if I stepped on your toes. However, surely you still believe that these issues are moot. Workable systems are as different as the internals of the people who make them up. I'm sure that some of the people who lived in ancient Greece believed in the justness of the slave state. (Though I doubt that it was very many of the slaves.) I believe that you and I both will probably find this course of study a way of life.

WB>>All I can say here is that freedom IS defined in many ways, you are
WB>>wrong. (Unless you restrict your world to only those individuals who
WB>>line up on fringe right.)

WB>I don't know about the fringe right, but other definitions of freedom
WB>can only be accepted if you're willing to empower the government at
WB>the expense of individual rights. Given that individual rights are
WB>logically a prerequisite to freedom, those other definitions are
WB>logically false.

When one begins considering the government to be a third party, or a 'big brother' so to speak, one has already admitted that we are no longer a self governing people. If that is the case, then we

have already lost all of our freedoms. If one does consider us TO BE a self governing people, then 'empowering the government' simply means governing period. I do NOT agree that other definations of freedom NECESSARILY lead one to the conclusion that individual rights will be lost, in general. In fact, I believe that some strategicly wise modifications of our defination of freedom would lead to greater individual rights on the whole.

WB>>WB>>A self governing people generally express themselves through the
WB>>WB>>vote.
WB>>WB> There is no direct correlation between freedom and
WB>>WB>democracy. One has to ignore many inconsistencies and unfounded
WB>>WB>assertions to believe otherwise.

WB>>Well, I agree (whew, finally). I agree with that. Yep. There are
WB>>many people who consider themselves free, who most of us living here
WB>>don't consider free at all. What right do we have to excessive
WB>>pride?

WB>Not much. I got a good laugh a few years ago when some politician
WB>applauded "the fall of socialism". He obviously knew that socialism
WB>isn't freedom, but in his ignorance he couldn't recognize either. The
WB>USSR just happened to have it spelled out within the name of their
WB>country. <g>

I object to your assertion that "socialism isn't freedom". Unless you are speaking from the politicians point of view. At our current level of discussion you realize the ambiguities that such a statement entails. Anyway, I understand and share the humor that you got from the fact that he obviously equated the USSR to the epitome of socialism, just because of the fact that socialists is in the name of the now defunct union.

WB>The heck with hurt feelings. Anyone who thinks we're no better than
WB>ants in a colony is a danger to us all, particularly in a democracy.
WB>As for accepting what we're handed, the same was true in the USSR
WB>until economic devastation forced a change. I only wonder what will
WB>happen *here* when our reserve of commercial initiative and natural
WB>resources are both finally depleted.

Well, perhaps, in a room of educated, self-restrained people. However, I believe that I have and ego, and I believe that you do and everyone else does too. Angry people sometimes kill other people. I agree that it would be bad for us to be ruled from either the perspective that we are all the same, or that we are all as dumb as ants (whichever or both that you intended). As for economic devastation, I need to send you a photocopy of my checkbook. Hee Hee. Just kidding, I am rather well off. (Well, compared to those who are really hurting, anyway.) I look forward to the day, when once again an engineer who sits down with a truely innovative useful idea and willingness to work can make use of his commercial initiative with the natural resources that you spoke of. (I realize that SOME people can do this today.)

WB>>Hmm... upon rereading earlier phrases up the chain in this
WB>>discussion I am suprised that you are choosing to express in just
WB>>this way. It sure seemed to me that you felt differently a few
WB>>messages ago. However, the misunderstanding was probably all in my
WB>>mind I guess.

WB>It's extremely difficult to convey the meaning of someone's position
WB>in a few paragraphs. Some folks don't even believe what they write,
WB>they just like to stir the pot. :)

Yes, but I see that you are not one of them. Neither am I.

: a waste of time using mobile amplifiers from Mirage or RF Concepts on a
: hill-top for lack of reliability under continuous duty. Has anyone had
: any luck using a mobile amplifier from Daiwa or Tokyo Hy-Power on a hill?
. . . . . .
Using a mobile amplifier in repeater service is Asking for trouble from
the start. We've used a Mirage amp for several years now with excellent
results.

Repeater Amps:
Use heavier copper traces on the PC board
Have heatsinks that are made for continuous duty
Usually have much more protection against faulty operation
(most have separate heat / SWR / overdrive protection circuits)
Have vented chassis to let internal heat escape.

Mobile amps are made for light duty intermittant service.

Don't look only at price. ALL manufacturers will tell you that their
mobile amp is automatically out of warranty if used in repeater service.

Good rule of thumb: NEVER overdrive a repeater amp and put a small
whisper fan on the back to guarantee good air circulation.

Small precautions, but the amp should run forever.

: - Cliff (KA6JRG)
. . . . . .
I purchased a T.E. Amplifier for our repeater and consider it the biggest piece of crap and even worse the worst service I've ever experienced. It took months to get the amplifier because "ham service" took a back seat to their 'other' clients, the amplifier was not working do to components missing, another month to ship another amplifier with a gouge in the heatsink that was poorly painted over. During the three months of lost time, the owner of the company kept assuring me that my amp was ready to be shipped, and wasn't.

Fortunately, I was dealing with T.E. through HRO who gave me an immediate credit when I asked for it, we bought the Mirage and lived happily ever.

A Nightmare Purchase ! -= 73 =- john k3nxu jlamar@yrkpa.kias.com

1925. Raynav 750 Loran info?

I bought a Raynav 750 Loran C navigation unit at a flea market. I'm not a pilot or a sailor, but by trial and error I was able to get it configured to find a master and two slave stations, and it gives me Longitude and Latitude. Unfortunately it seems to be off about 8 - 10 miles. I don't know if it needs calibrated or if I just haven't fed it all needed parameters. It has numerous settngs and modes. I deduced some of it but most is unknown.

I'd like to use it to ease grid square determination for microwave contests.

Does anybody know how I can get operator or service documentation on this thing? Its made by Raytheon, looks to be about late-70's or early-80's vintage.

>summarized, NICAD with low output.
>Dave
>VE3RRN
Dave, not to go into a long dissertation on NICADS, but, yes there is hope in your case. What essentially happens that causes the problem you see is called a shorted cell. If you took the battery pack apart and checked each of the cells, you would find one that has no output. If the cell is not in too bad shape, while it is apart, no need to disconnect the cells, (usually soldered), place a momentary 12 volts(or so) across the individual cell. look at the cell with the voltmeter, if it now shows 1.2volts or so you fixed it. If it still shows none, try it again. nothing ventured nothing gained. be carefull as there is heat generated by this process and the cell is subject to explode. I use a 12 volt bench supply to do mine with. the explanation is that miniscule fibers grow from one pole to the other and short the cell out. Hitting the cell with a high amp charge will usually vaporize the fiber. If the cell is still dead after a few tries, toss it. to recharge after this process you should drain the entire pack of cells. just short it out, with a piece of wire and take the whole pack down to about 3 volt range. then if you wish apply the 12 volts across the pack and monitor the voltage at the cells. when it quits going up, the pack is fully charged. charge rate for the normal AA sized cells can be as high as 250 ma. But, you can hit them with 2.5 amps for short duration and it will help prevent the fiber growth. If you have 6 good cells, optimal voltage is 7.2, for chargeing, you will see at full charge as much as 9 volts or so across the pack. This full charge will quickly come down to 7.2 and stay there for the rest of the usable cycle. There are some good references about all this available from past issues of QST, etc. You might even find it on one of the CD-ROM packs for HAM info. Long ago I used to run some RC cars on NICADS, Charge them suckers at 6 amps, discharge at about 35 amps in 15 minutes.
Good luck and hope you can get a bunch of life from the old NICADS, BTW, when you open up the battery pack, look for leaking, etc, if visible, toss'em as they will not come back if the electrolyte is depleted.

Wait a minute, let's not get confused here. That should read Jack, not
Steve. I only wrote the lines with the arrowheads (>) in front of them.
I was using the private property defination for "private". I agree with
you, in the way you have expressed it. However, for the purposes of the
comment, since the schools filled one need, Jack had a point. However,
to see the counterpoint one must imagine all of the needs of society (a
rather reflective undertaking). I couldn't possibly do it justice here,
there's not enough space or time.

MK> ->I have often felt that in many ways America is at both extremes like

Source record: 212469

MK> - ...There's no such legal
MK> -restriction against sales of radio equipment to unlicensed
MK> -individuals.

MK>Yes there is... It is legal for an Amateur Radio operator to use
MK>and possess an external power amplifier that will operate between
MK>22MHz and 30MHz. It is illegal for non-licensed individuals
MK>to use or _POSSESS_ such a device. It is therefore illegal to
MK>sell such a device to an unlicensed individual.
MK>For all of you picky people, non-licensed means that the
MK>person doesn't have a valid amateur radio or commercial
MK>license for which the device is FCC type accepted.

Note that the range is in the CB band. I think what Gary was talking about was the issue, *amateur* radio equipment. Boy also, note that the frequency range does not include a ham band, but supposedly hams are immune from the anti-possession law. (Better not let my sister carry it to the car for me. Sheesh.) Time to start wondering about the wisdom behind *that* law.

MK> - ...Restricting sales to amateurs only is equivalent
MK> -to limiting service in a resturant to whites only.

MK>No it isn't.
MK>One might say that it is just like having a "men only"
MK>restroom or "women only" healthclubs.

Yes and no. First of all, blacks can't change to whites, nor can we make the mistake of thinking that even if they could that it should be considered a prudent action. However, a non-liscensed person can change to a liscensed person and it is seen to be an honorable goal to have attained. Second, I know of no general complaint over the men/women restroom segregation. (I thought personal privacy drove that issue!)

MK>_Sex discriminating._
MK>Just as it is legal for business to give
"senior citizen discounts."

First, when the law refers to discrimination, either it specifies the type discrimination mean't, or it is up to the interpretation of the courts. I don't think too many people have seriously contested the issue. And I know of no general complaints. I thought that the fact that the elderly are known to have to deal with the 'fixed income' problem drove that issue. Hence, it might really be 'illegal' so to speak (or lets say 'of undetermined legality'), but who cares ? I am certain that if it was contested, that it would become legal at that

time for the simple fact that it isn't seen to hurt on the whole;
rather, it is seen to help on the whole.

MK>By the way, what does all this have to do with false advertising?

MK>Kevin, WB5RUE
MK>muenzlerk@uthscsa.edu

Yeah ? What does it have to do with false advertising ?

73, Gentlemen !

FREE - NEW Macintosh HAM TEST SIMULATORS

Studying for a ham test and have access to an Mac?

Upgrade Fast! Simulate the test and get S T I M U L A T E D!

Scores of 90% or > even get applause!

The new Macintosh Ham Test Simulators are HERE (and there if you can FTP)!

o Novice Ham Test 5.0 SA.sea
o Technician Ham Test 5.0 SA.sea
o General Ham Test 5.0 SA.sea
o Advanced Ham Test 5.1 SA.sea
o Extra Ham Test 5.0 SA.sea

The latest version "5" feature:

HyperCard 2.3 as a stand-alone application (SA) eliminating
your need to have HyperCard. All you need is a Mac with 4
Meg of memory and version System 7 or greater.

Each version "5" Ham Test Simulator has the latest questions
as prepared by the Question Pool Committee.

Each version "5" Ham Test Simulator is FREE OF CHARGE and work the
same way as the originals did (written by Diana, KC1SP).

You may obtain a version "5" Ham Test Simulator by mailing me a *FORMATTED
disk (1 per test) and include a Self Addressed and Stamped disk mailer for
the return.

Each version "5" Ham Test Simulator is also bundled with a shareware CW
program called MacMorse 1.4 written by Doug, WB0EON.

Also included in the version "5" collection are text files that relate an
interesting variety of ideas about the best way to study CW and prepare
for tests.

Or warm your phone line and get JUST the tests:

America On Line - Macintosh Ham Radio Section

or:

1933. Latest TCP/IP for Mac + Docs

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-13 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-1309950500060001@wd1v.mv.com>
Source record: 212471

Free - Latest Release of Macintosh TCP/IP software for Amateur Radio

NET/Mac v2.3.55 was born...

For those who don't know NET/Mac... NET/Mac is the application that supports TCP/IP over packet-radio, which means, that hamradio operators can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- A cosmetic enhancement for the 'netrom nodefilter' output
- Corrected some minor things
- Don't record the 'retr n' command in the popmail-file
- Force ARPA-net date-format the FTP-welcome message
- Introduce FTP-commands 'ascii' and 'binary'
- Return mail that has no hostname for destination
- Support 'ftext3 [<text>]' and 'ftext4 [<text>]' commands
- Terminate idle popmail-sessions after 127 retries
- Use ARPA-net date-format to calculate the age of outgoing mail
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL database yet... I am trying to convince Buckmaster that I need the new data-encryption-method, but as of yet they are not ready to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft

NET/Mac includes interactive HELP if you are just starting out. I also include a TCP.FAQ (Frequently Asked Questions) that even includes names and addresses of regional gurus and a "by the numbers" list of what you do to get operational.

Send me (1) one formatted disk and a *self addressed and *stamped disk mailer marked TCP/IP... 800k or 1.4 Meg disks are OK but they MUST be formatted.

73,

HS>ON THE OTHER HAND... I have been reading the posts occasionally,
HS>because I do like reading a debate that is being handled with
HS>care and respect for eachother. In most cases, this has been the case
HS>here, although, as we are all people, there are others who must
HS>abuse the language and other people simply because they are
HS>having a "bad hair day". That part's sad. Not a good image to
HS>people who are thinking about joining this mostly fun hobby.

Harry, it always makes my day to read kind warm words like the ones you wrote here. Thank you. I do admit to becoming involved to the point where I might forget a couple of things like I'm squeezing people for standing room. I enjoy it too, because I meet people like you and Jack, and Ken and Gary, and everybody else. Wish we could all get together for a group meeting one day, except I think that I am learning that we are not all in the same city ? Is that right ?

For sale:

Icom W21AT 2m/70cm dual band handheld. Hardly used (battery has been charged less than 8 times). Excellent condition. 13 months old.

All original packaging, manuals, etc. Registration cards have not been sent in (for what that's worth ;-).

I want a measly $329 for it.

email to:
leat@goodnet.com

Thanks!

I'm trying some new ideas in RFD and need some difficult-to-find
electronics...

selsyn/synchro pair, 60 cycle, 120vac.

sin/cos potentiometers, or sin/cos rom or eprom

A/D and D/A converter ICs, at least 7 lines of binary (128 count)

360deg (no stops) potentiometers, with tapering in at least 350deg
of the rotation

Also interested in used/broken/other misc direction-finding gear
you might have laying around the shack... (L-pers, SuperDFs, etc)
Any freq range OK, I'm trying to learn more than apply.
(although would like to see something for 10m OTHER THAN a loop)

THANKS!

Jim, I have had mine for 6 months now and like it a lot. I especially like the tunable memory. Even if you are in memory mode and select a channel, the big knob lets you start tuning! It is very good on AO-13 (recieve) and drives my amp to 225 watts!! Only complaint so far...why the hell couldn't Kenwood just give you the special mini-din plug with the rig? You MUST use this with an amp on ssb or the relay (in the amp) will drive you crazy! I found a surplus place here that had them for $0.99, I think.

P.S. NO, the Radio Shack DIN will not work, it is not a mini-din.

steve.sims@totrbbs.radio.org (Steve Sims) WRITES:
-MK>Yes there is... It is legal for an Amateur Radio operator to use
-MK>and possess an external power amplifier that will operate between
-MK>22MHz and 30MHz. It is illegal for non-licensed individuals
-MK>to use or _POSSESS_ such a device. It is therefore illegal to
<snip>
-Note that the range is in the CB band. I think what Gary was talking
-about was the issue, *amateur* radio equipment. Boy also, note that the
-frequency range does not include a ham band, ...

Wrong Steve. The range 22-30 MHz contains TWO, count 'em, TWO
Amateur Radio bands. 17 meters, 24.890 - 24.990 MHz and 10 meters
28.000 to 29.700 MHz. The CB band is from 26.965 to 27.405 MHz, right
between them.

-
-MK> - ...Restricting sales to amateurs only is equivalent
-MK> -to limiting service in a resturant to whites only.
-
-MK>No it isn't.
-MK>One might say that it is just like having a "men only"
-MK>restroom or "women only" healthclubs.
-
-Yes and no. First of all, blacks can't change to whites, nor can we
-make the mistake of thinking that even if they could that it should be
-considered a prudent action. However, a non-licensed person can change
-to a licensed person and it is seen to be an honorable goal to have
-attained. ...

-Second, I know of no general complaint over the men/women
-restroom segregation. (I thought personal privacy drove that issue!)

I don't know about your area but down here (Texas) we have rodeos
and such at a large coliseum. EVERY year many women are arrested
for attempting to use the men's restroom but never the reverse.
Generally it is because they get tired of waiting in line.....

-MK>_Sex discriminating._
-MK>Just as it is legal for business to give
-"senior citizen discounts."
-
-First, when the law refers to discrimination, either it specifies the
-type discrimination mean't, or it is up to the interpretation of the
-courts. I don't think too many people have seriously contested the
-issue. And I know of no general complaints. I thought that the fact
-that the elderly are known to have to deal with the 'fixed income'

-problem drove that issue. Hence, it might really be 'illegal' so to
-speak (or lets say 'of undetermined legality'), but who cares ? I am
-certain that if it was contested, that it would become legal at that
-time for the simple fact that it isn't seen to hurt on the whole;
-rather, it is seen to help on the whole.

These (restrooms and such) discriminations were ruled as legal
by the US Supreme Court because they were not malicious
discrimination. This also covers the senior citizen discounts.
BTW, most of us are on a "fixed income." We can't say "well, I
think I'll make $1000 more this month." (Salesmen excepted.)

This has nothing to do with whether or not a business has the "right"
to sell or not sell to a particular person or group as long as it
is not what is legally called "malicious discrimination." Not selling
equipment that requires a license to use to people who do not have
a license to use it is not malicious discrimination. I would be
willing to bet that this business that refuses to sell equipment to
"non-hams" would be glad to sell them any receivers or accessories
that do not include transmitters or transceivers. Just as it is illegal
to sell dynamite to a person/company that doesn't have a license
to use it. Just as most car dealers will not sell a car to a person who
doesn't have a driver's license. These are safety issues and an
entirely different subject. I'm sure that safety has little to do with
the reason that this company wishes not to sell to non-hams.
Now, if this business was refusing to sell to _black_ non-hams or
women non-hams, etc. while selling to _white male_ non-hams
then it would be considered malicious discrimination and would be
illegal.

1946. FT-51R battery monitor during Xmit

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-13 00:00:00 UTC
From: tlewis@dfw.net
Message-ID: <437s1a$hia@dfw.net>
Source record: 212484

Subject: Monitoring battery voltage during transmit - Yaesu FT-51R.

A while back, there were several messages on Internet indicating problems with monitoring the battery voltage while transmitting. Today, I had a very enjoyable conversation with one of the Yaesu Technicians in California and discovered you CAN monitor the battery voltage while transmitting.

Step 1 Be sure both bands are selected "ON" (frequencies displayed on both sides).

Step 2 Select desired band and frequency to transmit.

Step 3 Push the Sub-Op button once (three tones will be heard and the Main Channel indicator will flash on the non-transmit band).

Step 4 Push the function button.

Step 5 Within 5 seconds - push the SET/0 key.

Step 6 Select BATTERY VOLTAGE (function 25).

You are now able to monitor the battery voltage while transmitting :)

Note:

Battery voltage will be displayed while transmitting and receiving.

Transmit and receive frequencies will not be displayed.

The BATTERY VOLTAGE message will scroll across the display.

To exit battery monitor during transmit, simply press the SET/0 key.

> soon be antiquated, unfortunately.

If its only $100 difference, maybe I agree. On the other hand there is not that much difference between a 386 and a 486 and a 586 that there is any software that does not run on all of them. On the other hand there is a wide range of quality of motherboards for PC clones, name brands are not always the best.

For motherboard selection, hang around the FreeBSD and Linux users and see what works there. The junk breaks quickly under those operating systems.

Base your decision between 386, 486, and 586 on performance vs. price. Make the salesman earn his commision by proving the system will run FreeBSD, Linux, OS/2, and Win95. You don't want to find out after the fact how good any "comaptiblilty" warranty is.

Personally I prefer my PowerPC-based Macintosh 8100/80, but also have a 486DX33 running FreeBSD right next to it.

And because the original specific question was for a machine to support HF digital modes, the questor should drag his HF rig into the store with a dummy load and search for computers that don't emit tons of garbage and also maintain a stable video screen when the rig is keyed at 100W or so.

Hint hint: Macintosh's are good at the above test. On the down side you can not put a Clover (or similar) card in a Mac.

73,

1954. CATCC Press Release #2

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-13 00:00:00 UTC
From: steve.hajducek@bytewise.org
Message-ID: <127.3816.27@bytewise.org>
Source record: 212492

Subject: CAT Control Center (CATCC) Press Release #2
Date : 1995 - Wed. Sept. 13 20:27 Local/ Thur. Sept. 14 00:27 Zulu
From : Steve Hajducek, N2CKH

The response to monday's press release on CATCC has been truly overwhelming. I did not expect so many would read and reply so rapidly. Apparently the lack of really good (and inexpensive) CAT software is more of an issue that I had relized.

There were so many questionss that I will only answer a few key ones here:

Does your software exist or is it planned ?

CATCC does exist, it is currently in the final stages of beta testing by a number users.

Is CATCC a DOS or Windows program ?

CATCC been developed as an event driven MS-Windows application.

What radio does it support ?

The current baseline supports all current and most recent manufactur Yaesu F.F. cat radios and has been tested using the Yaesu FT-840, FT-890, FT-990, FT-1000 and FT-736R radios.

Does your program work with Kenwood radios ?

Sample programs to prove the Kenwood code have been written and tested on TS-440S/AT, TS450S/AT and TS-850S/AT radios to date, and is currently being integerated into the CATCC baseline.

Does CATCC support the FT-1000MP ?

I have no imformation on the brand new Yaesu FT-1000MP (or for that matter the new Kenwood TS-870S) however, unless there has been major changes or new control features added it should work just fine. Any added capabilities that the FT-1000MP may have over the bus will be integrated when I have the needed data.

Will CATCC support all Yaesu radios or is a separate program needed for each model ?

It was originally planned for CATCC versions for the various makes of radios to be created, one for Yaesu, another for Kenwood, etc., since the program so closely interfaces with the CAT transceiver. However, it has been decided to make one application for all radios. The first version of CATCC to be

released will support Yaesu and Kenwood. The user simply selects the model radio to be controlled. One H.F. radio and one VHF (or H.F. radio with transverter) can be controlled simultaneously.

How does logging work with your program, is it fully automated ?

There are two modes or logging, Full and Fast modes. With fast mode, all that need be done is grab the spot and click on Log. Fast mode however, is only usable when logging from a radio that provides all the required information. For VHF operations, Full logging must be used for most radios. In Full logging, what ever information can be read from the radio (if any) is and you fill in the rest. Full mode also allows the user to enter other information, such as QSL route or Grid Square, etc.

Does your program show every spot, like all the repeats that make another spot scroll off the screen before you can even use it ?

CATCC has two windows that pertain to the VHF packet dx-cluster. The main windows shows all activitity, while the spot window only shows the (1,000) most recent spots. An internal queue is also maintained on the last 30 new spots, no repeats will be placed in the spot window until it surpasses the last 30 unique new spots. A spot of N2CKH on 14195 and N2CKH on 14027 would both show up at the same time, but not if they are on the same frequency.

Your screen display shows hf and 6 meter spots, how does that work with the radios ?

If you have both an hf and vhf radio configured or two hf radios, one in use as the vhf with a transverter, than the vhf spot is sent tp the radio selected for vhf, either as the direct frequency or a 10 meter frequency for transverter use.

Does CATCC provide support for SWL operations ?

The CATCC software is designed for maximum control and operation of an Amateur Radio station. It was not designed to address the specific requirements on an SWL station. Another software project is in the works that addresses specific SWL requirements, it is not sheduled to appear until early 1996 however. It will provide support for all the Amateur transceivers with general coverage recieve (few don't these days) and the latest shortware receivers that have computer control support. Both a shareware/trial and full commercial version will be avaialable.

As previously announced:

The CATCCjr, the shareware/trial version of CATCC will become
available on September 28, 1995. It is NOT being made available
now.

What IS AVAILABLE NOW is the CATCC_PR.ZIP archive. CATCC_PR.ZIP
contains additional information on CATCC, including captured screen
displays in the form of .BMP files of the software in operation.
Also included are sample programs that WILL provide basic control
of both Yaesu and Kenwood CAT transceivers and a stand alone beta
version of the Accu-Rotor(tm) module.

The CATCC_PR.ZIP file is 921,295 bytes in size.

CATCC_PR.ZIP has been placed on the following ftp sites to date:

ftp.qrz.com
ftp.demon.co.uk

On or prior to September 28th, the CATCCjr software will be placed
on the ByteWise BBS and various FTP sites for downloading as
CATCCjr1.ZIP, CATCCjr2.ZIP, CATCCjr3.ZIP and CATCCjr4.ZIP. Each file
will be under 1MB in size (exact sizes will be posted). After the
files have been successfully transfered to all ftp sites, a message
listing all sites will be sent via e-mail.

Again, it must be stated that the CATCCjr version of CATCC is
basically a stripped down beta version of the full commercial version.
It is being made available to allow potential users of CATCC a method
to sample some of the latest features and comment on the software
during its final stages of production prior to purchase.

CATCCjr is NOT a supported product, it is not a complete product, it
is only a trial version. However, should it meet the users needs, it
can be used forever without any registration. However, CATCCjr will
remain the copyrighted property of N2CKH.

Unlike other CAT programs floating around, CATCC features full control
of a CATCC transceiver, NOT just frequency and mode control. Furthermore
it actually sets the frequency and mode correctly and by the way and
also reads information back from the CAT transceiver correctly too!

CATCC supports all bus commands that are meaningful, and does so
correctly. We support electronic tuning in a number or ways manually,
including clarifier adjustments (when supported). Filter selections on
the FT-990 and FT1000 and sub vfo operation on the FT-1000 is also
supported.

CATCC provides innovative features, some of which we will now briefly
describe as was requested by many e-mail messages.

AutoMode(tm) -

When enabled, will correctly select the default mode of the radio for the given frequency just tuned to in accordance with the ARRL band plan. Such that on 14000khz the rig would be set to CW, while on 14071khz RTTY would be selected and on 14096khz Packet and on 14196khz USB. For radios such as the FT-840 and FT-890, LSB would be selected in lieu of RTTY or Packet modes supported by the FT-990 and FT-1000.

AutoGrab(tm) -

When enabled, depending on modes of DX-Filer or All Spots, working in conjunction with AutoMode, as spots comes accross packet, your radio will follow the action, changing frequency and mode. This is fully hands off tuning operation. (NOTE: my beta testers love it, even though I thought of it, I just find it amusing.)

Band-Watch(tm) -

Allows the user to set one or more bands (1.8-1200Mhz) to be monitored for any DX Cluster spots and sounds audible alarm.

DX-Graph(tm) -

Graphically plots all DX-Cluster activity from 160 meters on up by a single band or range of bands. Provides various type of charts including Bar, Pie and Line.

DX-Filters(tm) -

Provides entry of up to 20 (seems reasonable number could be larger) DX prefixes or full callsigns to montior for and provide audbile alert when DX spot match is found. A user created default file is loaded at each program startup if it exists. The user can load a DX-Filter file, edit and save on the fly. If a DX-Filter file exists for the given date (created using DX-Calendar) it will be loaded instead of the default. Also, while the program is running, at Zulu day breaks, the system while check for a new file.

DX-Calendar(tm) -

Used to create and maintain DX-Filter files in advance. This is a pre-planning toll to ensure that you never miss that DX-Expedition again that you forgot about after reading in The DX Bulletin or else where.

DX-Sleuth(tm) -

To catch a the elusive rare one. This tool montiors cluster activity and notes every occurance of the particular callsign or prefix entered by date, time and frequency (mode determined by frequency). Then allows provides an analysis of this information to help determine a pattern that will predict the best day/time, frequency and mode to work'em.

Accu-Rotor(tm) -

Provides for automatic rotor control of a Hy-Gain DCU-1 rotor systeem. It provides for manual direct entry of 0-360 degrees, presets, bearing from Callsign/Prefix entry, Grid Square Entry or Latitude/Longitude entry. Optionally, when enabled, Accu-Rotor will automatically calculate the bearing and start rotation when a DX spot is selected from the spot window.

None of this really compares to seeing CATCC in action, although that requires waiting until September 28th for the release of CATCCjr, the captured screens in CATCC_PR.ZIP do provide a peek at the look of the software.

```
=========================================================================
| |
| Pricing for CATCC has been set at $49.95 U.S. (plus $10 U.S. |
| for the bound user's manual) plus 6% N.J. state sales tax (and |
| $7 U.S. shipping and handling within the U.S. and $15 all other |
| locations). All shipping within the U.S. will be by U.S. Priority |
| Mail. A tenative shipping date has been set for the first week of |
| November, 1995. Orders will be shipped in the order received, |
| payment in U.S. funds by U.S. bank check or U.S. Post Office |
| money orders. Cash will be accepted, however, cash orders are NOT |
| recommended, especially from overseas. |

1957. Yaesu FT-530 NICAD battery pack...HOW TO OPEN?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-14 00:00:00 UTC
From: orbelld@pcbe.edu.on.ca
Message-ID: <orbelld-1409950910420001@204.41.1.203>
Source record: 212404

From the informative messages in this forum, I've come to the conclusion that I've got a bad cell in my NICAD 7.2 volt battery pack.

Has anyone had any experience in opeing the battery packs from a FT-530? Can it be done in such a way, so that you can get it back together..... so that it will still attach properly to the FT-530?

I've noticed a "third party" 12 volt cells for the Yaesu FT-530 by Periphex, for a more reasonable price..about 30% cheaper. Has anyone ever tried this product?

And a Ray-O-Vac rechargeable alkaline is 1400 mAh. To boot, the nicad
is about $2, the LiMH is about $4, and the alkaline is about 50¢. To
top it off, nicad and LiMH are hazardous waste when they poop out
(heavy metals and all) and the alkaline is not.

No, I don't work for Ray-O-Vac, but I DID write an article to be in
the January issue of Kitplanes on the subject and I did do my
homework.

Source record: 212408

> Does anyone know of a 220/440 dual band radio? I don't care if it is mobile
> or handheld.
>
> I may be stuck buying a Kenwood 742a...

You are stuck buying a 742A. This dual band combination is not one the importers have seen fit to support. You can get 2m/440, 2m/220 (Icom V21 and Standard C228A), and 440/1200 (Icom X2A, X21A and Standard C628A) combinations. The worldwide demand for combinations *with* 220 and *without* 2m is extremely small and I can't blame the manufacturers for not having it.

Probably the only reason there are 440/1200 combinations is that this is a popular pairing in "the home market".

Message-ID: <439enl$7jj@ns.nmp.nokia.com>
Source record: 212409

I own that HR2600 rig, and I have seen mods for it in recent QST, but I haven't
seen any for the HR2510...

I'd like to use that 10m rig
for 70 cm transverter use. I need to extend the frequency coverage from the
current 28MHz..29.7MHz to be able to use the full 70cm band. I also need
to adjust the power down to few dBm0s for the transverter, alternatively I
could connect to a point before the PA and disable the PA if I knew how.
Any pointers to service manual or modification info is greatly appreciated.

Hi All! We're trying to get our club off the ground here in south Alabama (North Baldwin ARC) and are interested in upgrading our local repeater. At this point, we don't have a lot of money to spend on a controller, but have been looking at a controller marketed by Micro Computer Concepts in New Port Richey, Florida. It's called the RC-1000. Basically, I wanted to know if there is anyone out there using these and if so, what you think of them. I'd like to get a little information before we sink almost all of our money into one :)
Tnx and 73!

Hi Bob,

I am just about to order one for voice and 9600 packet use.
I am ordering from a catalog and haven't had a chance to get
some personal input from someone that actually owns one.
The local store doesn't have it and it is also cheaper to import
from the US directly. How easy/difficult is it to operate from
the mic/controller. Is it difficult to use? I know of some fellow
hams in the local club who have stickers attached to their HT's
to remeber some of the programming sequences...
Any input is greatly appreciated!

Tnx,
Manfred

Yes, however, that delivery is only at a very low current drain level.
As you increase current drain the Ray-O-Vac capacity drops markely.
I've found they Ray-O-Vac is great for a receiver, but not so hot for
something involving transmitting. They (Ray-O-Vac) publish some good
application notes on the products (just call them at the address/number
on the product's package).

Get a clue..... the internet is changing. Marketing is what is making
the internet interesting. (i.e. WWW)

Brief rant:
I want more kits and plans for amateur equipment. SMT does not scare me.
This simplex repeater in kit form sounds like a good idea. I however need/want
kits of a different nature. (direction finding). I hope more companies decide
to MARKET some designs and advertise them HERE where it is cheaper, thus less
cost is passed on to me.

The "technical" term for this is zapping. But you shouldn't use a
heavy bench supply. To avoid the danger of explosion, you should
use a capacitor instead. One of the nice big fat "computer grade"
capacitors, of about 250,000 uf or so, will do nicely. Charge it up
on your supply. Then disconnect it from the supply and apply it across
the shorted cell. The momentary current surge should be enough to "zap"
the whisker without being enough to cause the cell to overheat or explode.

>If the
>cell is still dead after a few tries, toss it. to recharge after this
>process you should drain the entire pack of cells. just short it out,
>with a piece of wire and take the whole pack down to about 3 volt range.

DON'T DO THIS. This is one of the best ways to *ruin* a Nicad pack.
NEVER short a battery pack. The weakest cell *will* be reverse charged
by the others, and most likely ruined. If you *must* fully discharge
Nicads, do it *one cell at a time*, and at no more than the rated
discharge amperage. If you want to discharge a battery pack to a known
state, discharge it at rated current to a terminal voltage not less
than 1.0 volt per cell. Going below this point risks reversing the
weakest cell in the pack. If you *must* discharge a pack to zero,
do it *one cell at a time*. (There is sometimes reason to do this.
This will tend to equalize the cells so that they'll take charging
current more or less equally. It's not a routine practice, however,
since fully discharging a Nicad cell shortens its life dramatically
over just discharging it to the 1.0 volt level.)

I've had some problems with this type of cell self-discharging rather rapidly. If you don't use them for a couple of weeks after charging, they'll be flat when you try to use them. Nicads self-discharge too, but not nearly as rapidly. Just something to keep in mind.

>from the US directly. How easy/difficult is it to operate from
>the mic/controller. Is it difficult to use? I know of some fellow
>hams in the local club who have stickers attached to their HT's
>to remeber some of the programming sequences...
>Any input is greatly appreciated!

This is one of the radios I was considering for my Jeep. I
played with one for a couple of hours, manual in hand and
salesman at my shoulder. It's confusing, and it's very easy
to accidently hit the wrong controls. For example I kept
raking off the volume or squelch when handling it. Also,
the volume knobs double as the bandswitches. They feel very
delicate, and I wondered how long they'd last. There were
some modes neither the salesman nor I could figure out.
He called factory tech support, and *they* couldn't figure
them out either.

Since, unlike the Standard that's also microphone controlled,
you still have to find a place to mount the separate display,
and pay for the remote mounting kit for that too, or find
a place to mount the entire rig where you can see the display,
having all the controls on the microphone isn't as big an
advantage as it may at first seem. The Standard has some
quirks too, but seems much more generally usable. Both
rigs *claim* to be 9600 baud ready, but I haven't tested
either to see if that's more than just advertising hype.

Note, the mike's a *big* sucker too.

Gary

1972. Kenwood uses false advert

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-14 00:00:00 UTC
From: MUENZLERK@uthscsa.edu
Message-ID: <01HV9PMXWWLU00DNOU@uthscsa.edu>
Source record: 212419

jdb99@ix.netcom.com (jdb) writes:
-In <01HV837TKL2Q00DF8E@uthscsa.edu> MUENZLERK@uthscsa.edu (Muenzler,
-Kevin) writes:
-
->This has nothing to do with whether or not a business has the "right"
->to sell or not sell to a particular person or group as long as it
->is not what is legally called "malicious discrimination." Not selling
->equipment that requires a license to use to people who do not have
->a license to use it is not malicious discrimination.
-
-When we were sued by two individuals we refused to sell to,
-your comment is almost a "word for word" quote from the judges
-decision. We were fist sued in our local civil court, the
-case was thrown out because it did not fall in their jurisdiction.
-When it went to Federal Court this was the ruling.
-Despite the fact their is no law, a license is required for
-the use of the transmitter. This is how the court ruled. The Appeals
-court refused to hear the case, and that was that. It was not
-applealed to the Supreme court.

There are always those who try to make up civil, or otherwise,
rights to suit them. There are always those who will take existing
rights and pervert them to suit their needs. I suppose you're
business had to pay big bucks in legal fees for this one too! I'll
also be willing to bet that those two "customers" had a pro-bono
lawyer that was just itching for a civil rights fight. He was just
waiting for the judge/jury to come down on his side so that he
could collect his half of the settlement.
I was on a jury for such a suit. A person, name/sex/color deleted
to protect the ridiculous, was suing because this person was
arrested for going into the wrong restroom. This person claimed
that the exclusivity of the restrooms violated the civil rights act
of 1964. I, and many of the other jurors, were astonished that
it even came to court. I'm sure that, in your case, the Appeals
Court saw how ridiculous the case was and was just saving
you and the taxpayers lots more money.

->I would be
->willing to bet that this business that refuses to sell equipment to
->"non-hams" would be glad to sell them any receivers or accessories
->that do not include transmitters or transceivers.
-
- All the time.... When someone came in out store and wanted
-to become involved in the "HOBBY" then we spent a LOT of time
-explaining the rules and regulations and when we had classes

-and when the test schedule was etc....What we found is those
-who wanted to become hams, did what was necessary to become
-licensed to exercise that priviledge. ...

Any smart businessman who was in the business of selling
Amateur Radio equipment would be a fool to refuse to sell anything
to non-licensed individuals. Most stores will be glad to sell
any accessories that do not involve transmitting to anyone who
wants to buy them.

-Those who tryed to
-just BUY a transceiver right then and there, were not interested
-in becoming hams, but were looking for ways to "work some skip."

Exactly! These are people who will modify the rig to transmit on
11 meters. Unfortunately many hams get caught transmitting on
11 meters with their modified rigs. These are people who should
know better. Almost monthly in QST there is someone who has
been a ham for many years caught using an unapproved
piece of equipment on 11 meters. You would think that these
people would get more enjoyment out of the ham bands than
trying to punch through all of that garbage on 11 meters.

Kevin, WB5RUE
muenzlerk@uthscsa.edu

I'm not a lawyer nor do I play one on TV. But I did watch a
couple of episodes of LA Law and Perry Mason.

1973. Subaudible tone on PCS2800 (10FM)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-14 00:00:00 UTC
From: webster@godzilla.gsfc.nasa.gov
Message-ID: <4398v1$8i0@post.gsfc.nasa.gov>
Source record: 212420

I have an (old, vintage 1980) Azden PCS 2800 10 meter
FM transceiver. Since many repeaters have converted
(at least in the US) to subaudible tone access, I want to
add a subaudible tone encoder to the PCS 2800. Has anyone
performed this modification? Are there any recommended
encoders that have demonstrated high reliability.
Reply by email, please. I will summarize any responses.

Will Webster, WB2TNC

Source record: 212422

I would really appreciate any help or info on this project. Maybe somebody here has built something similar to this, and could E-mail me tips or schematics but do not post for my benefit because I do not frequent this group.

Okay, I need a DTMF pad hooked up to a inexpensize short range transmitter walkie-talkey, homebrew,or somthing like that. I need to have my reciever fire a relay or solenoid or something when the proper 4 digit code is entered. P.S. must be portable (DC) My problem is I have little expertise, but I could have somebody build it properly if it is too involved. Tips on where to salvage circuts from for this are also appreciated.

Thanx. E-mail me

Source record: 212424

I have had one for about 6 months and love it. I have a mag mount 1/4 wave on the front hood of the motorhome which I use like a car and The radio gets out very well with the forty watts on fm and lets me scan all the repeater frequencies as well as fm simplex and sideband spots. My next project is to get my sideband two meter antenna up on the motorhome so that I can do more work with that part of the radio. My only caveat is how can they call it an all mode when it does not have am. I worked a lot of six meter dx on sideband with the ts 60 all mode and a 1/4 wave vertical this summer from the motorhome. Just did not spend the time on 2 meters looking for the same.

1978. Kenwood TH79AD help.

From: seguine@interval.com
Message-ID: <seguine-1409951521010001@marg.interval.com>
Source record: 212425

I performed surgery on my TH79AD and removed the two microscopic diodes at D304 & D307. According to the Artsci book and the mod at oak.oakland it should now tune from 67-174 and 400-511. Mine will only tune from 118-174 and 410 to 470. Are you suppose to cut the green wire (MARS/CAP mod) as well? Or did they change newer radios to be more restricitve?

Source record: 212426

Hi, I'm wondering if anyone has been able to modify the following
for a Kenwood TH-79A handheld. I have a friend who is interested
in monitoring 800mhz (local LE, FD, SO) is all on trunked radio and
he bought into the radio with the hope that the radio had a mod for
800mHz as well, since the fact that the radio before it TH-78A did
in fact have a mod, and might I add receives 800mHz quite well.
Second mod is for expanded RF, the radio has already been mod. once
to transmit outside of the amateur band for MARS/CAP, but is not
select enough, is there ANOTHER modification out there to allow
the radio to transmit from 140mHz to 174mHz? I know the TH-28 and
TH-78A will do this, but so far I haven't been able to find one
on the TH-79A.... thanks, please email me with any responses.

No mentions as to FCC Rules on this either, I am aware already thankyou

Source record: 212429

The following is a list of military transimitting equipment. The BC
191's of course have 4 211/VT4C
each. Three of the four in each one look new, and I had planned to take
them all out. So bid without those
tubes included. If you want tomake an offer with the tubes left in,
include that as well as a bid without
them.

BC191E with TU-6B which tunes from 3000-4000 KC (hard to find)

BC191F with TU5N which tunes from 1500-3000KC (also hard to find)

T-20 in black tunes from 3-4

T-20 in silver tunes from 5.3-7

The next three are in a single rack. They have transformers on the rear of
each that unplug leaving the
original socket.

R-24 marked MT-7 tunes from .52-1.5 three antenae jacks black in color.

R-24 marked Western Electric BC-455B tunes 6-9.1 silver in color.

R-24 marked Western Electric BC-453B tunes 190-550 KC silver in color.

R-24 black tunes .52-1.5 this one is in it's own single rack. Has a
removable transformer on the back
which would leave it with the original socket

Radio receiver BC966A

Radar unit SN36A (I know nothing about this thing)

Wireless set No 19 MK II supply unit No 1

Organization: AT&T Bell Laboratories
Lines: 30

copied from packet:
Msg# TSF Size #Rd Date Time From MsgID To
63056 BF 1307 1 14-Oct 1645 N2FWQ 49200_N2IMC MODS@ALLBBS ()
Sb: knwood tm421a mods

This mod is only intended for experimental applications only! Know what
freq you are on and don't use this mod if you are not for sure.
The TM-421a is capable of transmitting from 136 to 174 MHz when the following
modification is performed. The transmitter specifications will vary from
published in-band specifications.

1. Remove the top and bottom covers from the transciever.
2. Remove the knobs from the front panel.
3. Remove the nut from the mic jack and the nut from the channel selector
switch.
4. Remove the 4 screws that secure the front panel to the body of the
transceiver
5. Pull the front panel off the transceiver to expose the Control board.
6. Remove the 3 screws from the Control board. Gently pull the board off
the transceiver.
7. Cut the GREEN jumper wire on the Control board.
8. Install an MA141A chip diode or 1N914 diode as D209 on the Control
Board.
9. Reassemble the transceiver by reversing steps 1 - 6.
10. Reset the microprocessor by holding in the MR key as power is turned
on.

I haven't tried or verified this, proceed at your own risk. WA2ISE
And do not transmit outside of legal bands!

Copied from the QRZ! Windows Ham Radio CDROM

Here are the mods for the Kenwood Th79-A dual band hand held. I cannot take credit for any of the mods, however they were given to me so I thought I would share them. By the way if you have any mods for any other Amateur Equipment please email them to me and I will be more than willing to share them with others.

Thanks and 73...Steve VE9SHM

Kenwood TH79 Dual Bander Modification and Feature Guide r1.5 9/13/94
==========
Clayton Wagar, KD4IDN
920 West Crawford Street #7
Dalton, GA 30720

Here is a compiled list of modifications and features I've found for the Kenwood TH79 Dual Band HT.

Thanks to the following for their contributions to this document:
Mike Musick, N0QBF
Cole Cunningham, AA7RD
Duane Voth, KC5BGV
Chuck Scott, N8DNX

Having had many other radios in the past, and certain to have many in the future, I understand the anticipation of Amateur Radio operators to find modifications to their equipment. I started this document because I want to see _quality_ information circulated as quickly as possible, in order to save a lot of time and effort for others.

If you have any other comments, mods, or information you would like to see included in this document in the future, please send them to:
Clayton Wagar KD4IDN
yensid1@aol.com

Outstanding questions at the time this document was released:

* Rumor of a keypad modification to the radio for "Wide band" TX, RX. If you know of this mod, please write to me, even if you wish it not to be published. This would save a number of poor radios from useless torture!

Hope you find all of this information useful. Again, please send corrections or additions to yensid1@aol.com

73 de Clayton
KD4IDN

++
I. Disclaimer
++

Well, don't you get sick of this stuff? I know, I know. However, I must say that I cannot and will not be responsible for anything that might happen to your radio, your person, your dog, or other operators you might talk to with your th79. In addition, if you decide that, with your newly modified HT, you just absolutely must cause unlawful interference with another ham or another radio service, I won't pay your NAL. Really.

Oh, and while we're at it... The extended RX/TX modifications may require you to solder or desolder really, really small components. If you want to know how small, look at the tip of an average ball point pen. Smaller than that. It takes about 1/2 of a second to wipe out several components as well as fry the board inside the 79. Please be careful.

++
II. TH79 Description and Impressions, by Mike Musick, N0QBF
++

Lulled by the sexy small size, I succumbed (or, rather, the credit card succumbed) and bought a Kenwood TH-79 dual-band H-T recently. Already owning a TH-78, the comparison comes easy.

SPECS. The TH-79A is a U.S.-spec dual-band transceiver, featuring coverage from 144-148 and 438-450 MHz. Receive coverage is extended on the 2M side from 118 to 174 MHz with AM in the aircraft band; there is no extended UHF coverage without modification. Max power is rated 5W on VHF and 3.5W on UHF with a 12V source; max power with stock 600 mAH nicad pack is 2.5/2.0. There are three power levels for each band - high, low, and extra-low (30mW). There are 80 memory channels, with no evident expansion capability. U.S./Canada version comes with the CTCSS encode/decode option. Going price at a 7/17/94 hamfest was $480.

GENERAL IMPRESSIONS. Tiny, tiny, tiny. Imagine putting a small duckie on the ARRL Repeater Directory - except that the 79 is narrower by about an inch. With the standard battery and not counting the belt clip, the dimensions are roughly 2" wide, 5" tall, and 1" thick. The belt clip adds 3/8" to the thickness; I

left it off so it would be pocketable, and, frankly, it fits moderately comfortably in my work slacks' front pockets, which was surprising. It's tiny! (Oh, I said that already.)

The 79's keyboard has larger buttons than it's predecessor (lacks the cover, too) which are much easier to use. Control layout in general is better and even in just a couple of days I appreciated the change. No more ambiguous power switch - it's in the primary band volume knob in a normal OFF/ON/VOL setup. Secondary band volume control is on the "ring" of the freq/channel encoder knob in a coaxial arrangement.

There are no squelch knobs; it a key+knob function for both bands. Squelch control was, well, interesting. There are only six "settings", with usually only the lowest setting opening the squelch under no signal. Reading between the lines in the manual, apparently the squelch circuit is semi-automatic. I expected some limitations, but had no complaints under actual use - it worked well.

With my expected habit of putting it in my pocket, I like the control lock switch - it's *not* an F-key function, but, rather is a slide switch next to the PTT. No more fumbling around to unlock it. Unfortunately, the lock function does not lock PTT - that has to be disabled with the "Tx Stop" menu setting. I found this out the hard way by putting it in my pocket and inadvertently keying-up a repeater.

The 79 has an alphanumeric display capability of two lines of 10 characters, which is used in several ways. First, there is a "guide" facility, which provides online instruction for most operation features with a scrolling display. Then there is a "menu" function, which provides access to the settings which were normally done with obscure F-key commands in the 78. Setting the various functions is very clear this way. There is also a status review mode, where the more important settings are displayed.

Finally, the alphanumeric display can be set for each programmed channel. Seven characters positions are available, and almost the entire extended ANSI character set - that's right: lower case, symbols, and accented characters - can be used. However, alpha display is mutually exclusive with frequency display. Frequency display mode can be selected in case you forgot what was "underneath" your programmed channel ID.

++
III. MARS/CAP Modification provided by Mike Musick, N0QBF
++

Here is the MARS/CAP modification for the new Kenwood TH-79A dual-band HT. Usual disclaimers about doing mods apply.

1. Remove battery.

2. Open case by first removing 3 screws (#00 Phillips) on back
and 1 screw on side hidden underneath the rubber flap covering
the DC power jack. Gently pry apart starting at top; BNC
connector will move with back, knobs with front.

3. Spread unit out. Wires will "hinge" on the side with the PTT
button.

4. Looking on the back of the keypad (front) half, locate green
wire on upper left, just below the CTCSS decoder module.

5. Neatly cut this green wire, and tuck back in so ends won't
touch each other or other components.

6. Reassemble.

Programmed memory will be lost since the CPU will notice the
strap change and reset itself.

End result -

Before: VHF RX - 118.000-173.995 TX - 144.000-147.995
UHF RX - 438.000-449.995 TX - 438.000-449.995

After: VHF RX - 118.000-173.995 TX - 142.000-151.995
UHF RX - 420.000-449.995 TX - 420.000-449.995

Automatic repeater offset and shift selections remain normal.

And this tip comes from Duane Voth, KC5BGV...

"The MARS/CAP mod can be made without opening the entire case up. You
can fairly easily cut the green wire by simply (and carefully) removing
the CTCSS decoder cover and using a small pair of diagonal wire cutters."

++
IV. "Wide Band" Modification, provided by Cole Cunningham, AA7RD
++

Following is a modification for the Kenwood TH-79A Dual Band HT which
opens it up to tuning from 67-174 MHz and 400-511 MHz. Actual receive was
85-135.995 AM and 136-179.995 FM with reasonable (0.5 microvolt
or better) sensitivity at all the points I measured. Transmit was
136-179.995 and 400-511 with power dropping off at the ends but still
usable (about 0.5w on the high scale at the band edges).

As usual, I take no responsibility for the mods, or your use of the unit
after mod. Please exercise good judgement and don't endanger our ham bands
with your irresponsible actions.

The observations noted are all I tried and I have no further data.
This is such a delicate operation that one shot was all I wanted to do,
and when it worked I quit!!!

WARNING-CAUTION-LOOKOUT-ETC!!!
The diodes to be moved are microscopic!! About 1mm long by 0.5mm wide.

This mod should be done by professionals on a closed track only.
Children, do not attempt this at home. Requires extremely small soldering
tools and MUCH skill. I had a professional surface mount facility do mine...

1. Open the unit by removing three screws from the back and one under the
DC power input cover. Carefully separate the front and back pieces.
The two case halves may be disconnected by pulling the wired plug and by
prying the brown latch on the ribbon cable connector up enough to
release it.

2. On the front PC board in the lower right corner as viewed from the rear
with the knobs pointing up there are seven spots for diodes in a row,
with one diode missing.

```
|
o o o o x o o |
_______________|
2 3 4 5 6 7 8
```

The numbers are D302-D308, left to right, with D306 missing.

3. Remove D304, and D307. Put them away in a safe place (Just in case...)_

4. You should now have:

```
|
o o x o x x o |
_______________|
2 3 4 5 6 7 8
```

5. Reassemble and good Luck.

Enjoy, but don't create problems with the new capability...Wouldn't it be
nice if Kenwood would make a RX only mod with these capabilities and we
wouldn't have to worry about accidental transmissions where we shouldn't
be transmitting. I, for one, don't want or need to TX, just RX...

73, Cole, AA7RD
August 11, 1994

(Note - This mod also adds 2 more menu settings. One of which is an
AM/FM demod selector for the 300-400 Mhz band. To access this
band, select the VHF band, press F, then press the Low/Hi key.
Repeat to return to 144 Mhz. The AM/FM selector will allow you
to listen to Military transmissions in the 300Mhz band in
either AM or FM.

V. Remote Base Operation with Kenwood 732/733
++

Kenwood has now simplified remote base operation of their mobile rigs
with the TH79.

I will not give a step by step on how to control the mobile rigs, since they are different. Hoewever, to really understand this feature, I would first get to know the remote control feature on the mobile very well. This makes the following explanation a little clearer!

To access this feature, hold [PTT] and [MR] while [POWER ON].

The display will indicate -RC-, which I presume means 'Remote Control'.

If you have correctly matched your DTSS codes, frequencies, etc, the dual bander's keypad now becomes a function pad. Pressing certain keys enables or disables functions on the mobile rig by sending the DTMF sequences for you.

Please note that all this fuction does is send the DTMF tones over the air to control your mobile rig. I have not made a list of what each key does, but as the 79 sends the DTMF tones, the display will indicate the function. (i.e. - RPT ON, RPT OFF, TONE ON, TONE OFF, etc.)

73 de Clayton
KD4IDN

And this from Chuck Scott, N8DNX...

"The "RC" function is configured to directly control radios such as the TM-732. In fact, if you look at the layout of the microphone remote commands for the 732 it very closely matches the key assignments for of the "RC" mode. Since I have a TM-732 installed in my car, I had a chance to try this out and it's VERY convenient. Everything from direct frequency entry with the "F" key to enabling X-Band repeat. I'm really surprised they aren't marketing this feature of the radio."

++
VI. Post Modification Spec Sheet, by Clayton Wagar, KD4IDN
++

Here is a small chart showing the measured specifictions of TH79 S/N 60300272 after modification. The measurements were made with an IFR 1200S Service Monitor, on the bench, with a 6V power supply. Your milage may vary - these are just what happened with mine, and I would suspect that most units are pretty similar.

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
VII. Cross Band Repeat, from Chuck Scott, N8DNX
++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++

The TH-79 does go into X-Band repeat. Press the "F" key then the "MONI"
key to enter repeat mode. Use the same to return to normal. There is a
10 min transmit limit so it's not useable for long duration monitoring of
a continuous transmission. That's understandable in light of the number
of horror stories I've heard of people frying their HT's in repeat mode.

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
VIII. Other Observations, Ramblings, Etc.
```

++

From Chuck Scott, N8DNX....

"Regarding the lack of a memory Lock Out function, I talked at length with the Kenwood people. They have been inundated calls about this and have told me that they are preasuring Japan to come up with a processor replacement to fix this, perhaps as a retrofit. I encourage any owner of a TH-79 to write to Kenwood insisting on such a modification at no cost and asking that they be informed when it is available. I think this is justified for several reasons. First, I have been told by another ham that the official brochure indicates that such a feature is included. Second, and more important, it is arguable that the radio is not suited to the application without memory lockout. After all, it's an 80 channel radio. To make effective use of that many channels REQUIRES a channel lockout function. Without effective use of that many channels, the radio is not comparable to the current standard for such a unit.

BTW, close inspection of the RF deck in my radio shows no obvious missing parts. I didn't remove the board to check the other side, but my suspicion is that the 800 MHz parts are installed. I'd be interested in input from others on that. So far I've not discovered how to make it display any 800 MHz frequencies though."

1985. WANTED: Uniden HR2510 mod info

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-14 00:00:00 UTC
From: Timo_Kolehmainen <tko>
Message-ID: <439931$7jj@ns.nmp.nokia.com>
Source record: 212432

I need modification info for the above radio. I have seen info for HR2600 but nothing for this...

I'd like to use that 10m rig
for 70cm transverter use. I need to extend the frequency coverage from the current 28MHz..29.7MHz to able to use the full 70cm band. I also need to adjust the output power down to few dBm0s for the transverter, alternatively I should connect to a point before the PA and disable the PA. Any pointers to service manual or modification info is greatly appreciated.

>a license to use it is not malicious discrimination.

When we were sued by two individuals we refused to sell to,
your comment is almost a "word for word" quote from the judges
decision. We were fist sued in our local civil court, the
case was thrown out because it did not fall in their jursidiction.
When it went to Federal Court this was the ruling.
Despite the fact their is no law, a license is required for
the use of the tranmitter. This is how the court ruled. The Appeals
court refused to hear the case, and that was that. It was not
applealed to the Supreme court.

>I would be
>willing to bet that this business that refuses to sell equipment to
>"non-hams" would be glad to sell them any receivers or accessories
>that do not include transmitters or transceivers.

All the time.... When someone came in out store and wanted
to become involved in the "HOBBY" then we spent a LOT of time
explaining the rules and regulations and when we had classes
and when the test schedule was etc....What we found is those
who wanted to become hams, did what was necessary to become
licensed to exercise that priviledge. Those who tryed to
just BUY a transceiver right then and there, were not interested
in becoming hams, but were looking for ways to "work some skip."

1991. Nicads no! Lithium Metal Hydride best!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-14 00:00:00 UTC
From: bluospry@ix.netcom.com
Message-ID: <438dqj$plg@ixnews7.ix.netcom.com>

While Nicad batteries have been the standard in HTs the new Lithium metal hydrides are superior. For example a standard AA Nicad is 500 ma, a high capacity Nicad 850 ma and a Li Metal Hydride AA is 1200 ma. "AA"s and "A"s maybe obtained from Tower Hobbies (they have an 800 number). 73s

I am a Paramedic and am looking for a portable radio for personal use. It must be programmable transmit/receive for frequencies that I am interested in(police, fire, ems, hospital). These are all VHF freqs and must be able to handle programming of PL's for each freq. I would like at least 30 channels that can be scanned.

I have seen a very nice Kenwood that someone told me was around $700. Any recommendations? Please email me if you don't mind. Thanks...

Actually HRO in New Castle DE is not significantly farther from center city
than Trevose PA is. And while there _is_ a SEPTA stop called "Trevose" (on
the R3 Regional Rail line), it's a long enough hike to Trevose Electronics
that you really need a car for either place.

In article <9509112000.0S4B70B@asb.com>, rick.lapp@asb.com writes:
|>
|> Anyone know how to setup the 733 to work as a crossband repeater?
|>

Yep. Select either band py pushing in on the volume control. Then
press the CONT button, so that PTT is set to one band, and CONTROL
is set to the other. (CONTROL is indicated by the little green light
near the volume control. Then press and hold the FUNCTION key for 1
second to bring up the third menu for the softkeys. The far righthand
most key is marked X. Press that and you are in X-band repeat.

To get out of X-band rprt, just press and hold F for 1 second, then hit X.

Note: If you only want to repeat 1 direction, just skip the part where
you set PTT and CONT to seperate bands. With PTT and CONT set to the
same band, it repeats only one direction.

Once in X-band repeat, most of the keys are disabled. Some useful tips
for X-band repeat on this radio: Turn off the display before setting in
X-band mode. (To do this, hit F then DIM then turn VFO knob til display
turns off). You can turn both volume controls all the way down on this
radio, unlike some, where the audio repeat level is set by the volume
control. Its not a good idea to have your car speaking as it sits in
a parking lot somewhere.

>Max
>N7NWG

Max, I also own a TS-440. I had the same question and was told by an individual that was selling one at a sidewalk sale that it was very easy to adjust the power level. He said that there is a pin on the rear 6 pin Din accessory jack (remote connector) that is for ALC input feedback from an amplifier. It is pin 6. He said that if you regulate a voltage and apply it to this pin and ground, it will reduce the output. He suggested that I use a 9 volt battery and a pot to adjust the level to the desired output. I never got around to trying it, but it appears that it will work, since this ALC input is designed to reduce the drive to the amplifier. If you try it, please let me know if and how good it works. 73's

Hello... I need info in getting started on Six meters FM and SSB. I've seen some of the older micors and GE master II's that are available, and the advertisments for the Azden radios, but need advice on what would be an acceptible starting setup for mobile use. There are some 6 meter FM repeaters around New England, but sideband holds a great bit of interest to me as well. Any multimode rigs manufactured? Price is of great concern, I've convinced my wife that since my 440 rig has gone up in smoke that I should have something else in the car for Christmas...
If you've had experience with 6 meters, I'd like very much to correspond with you... Typical ranges for FM mobile vs sideband, amount of activity on the band, types/brand/set ups for mobile antennas, rigs to avoid or look for, price ranges, etc. etc. etc. . I live in the metro Boston area, and travel regularly into far northern New England so most of my radio time is limited to mobile use.
Thank you very much, please e-mail me with any suggestions or comments you may be willing to share to:

eplumley@lynx.dac.neu.edu

Again, thanks and '73's

Eric Plumley / N1QMZ

2000. FM RECEIVER/TRANSMITTER

Cleo forgot to mention in the above article that the "vampire" was also a
ham...

Could be those scratches were really caused by a "rubber ducky"!

Source record: 212310

Hi,

Can anyone supply information about the SGC (SG-2000) Marine SSB/Ham
Tranceiver?
Is this the only one Type Approved for both Marine and Ham use?

Does the Marine SSB feature effect its capability as a Ham radio?
Is SGC a reputable company?
Is this a quality radio?

I'm planning a boat trip and want the Marine SSB capability. Whith the
SG-2000 when I gat a Ham license there won't be a need for another radio.

Thanks!

Helmsman1@aol.com

2006. New Yaseu HT?

From: kjsmith@violin.aix.calpoly.edu
Message-ID: <43cv45$1nto@violin.aix.calpoly.edu>
Source record: 212311

Does anyone have any info on the new Yaseu single-band "mil spec" (for target practice?) HTs that I see on the back page of October QST? They look interesting.

Is DCS compatable with DPL (same thing, or some weird ham bastardization?)? Fast scan speed = ? channels per second?

I've sworn off buying ham gear after getting tired of the quality (I own Icom and Alinco [the Alinco is better than the Icom!]), and use Motorola at work...but this Yaseu COULD make me reconsider.

2007. CATCC Q&A #1

Newsgroup: rec.radio.amateur.equipment
Date: 1995-09-15 00:00:00 UTC
From: steve.hajducek@bytewise.org
Message-ID: <127.3823.27@bytewise.org>
Source record: 212312

Subject: CAT Control Center (CATCC) Q&A Bulletin #1
Date : 1995 - Thur. Sept. 14 18:10 Local/ Thur. Sept. 14 22:10 Zulu
From : Steve Hajducek, N2CKH

The questions keep coming in, the response to the press release on CATCC has been way beyound what I expected. I did not expect so many would read and reply so rapidly. I also did not expect the large number of overseas direct phone calls to the support BBS.

There are so many questions being asked that I will now start to send out this Q&A bulletin until the flow of questions taper off.

Here goes:

I downloaded your CATCC_PR file and found your sample programs very interesting as well as your Why 1024-768 screen captures, but why doesnt all the Kenwood functions like A/B and SPLIT work ?

You are absolutely correct. I have verified that I screwed up and I must apologize. Apparently when I updated my new e-mail address in the help information and rebuilt the Kenwood programs for CATCC_PR I inadvertantly used an older baseline. This has been corrected and is available on the BBS for download, it will take a day or two to get it to the ARRL BBS and the ftp sites.

What qualifies you to write software ?

Interesting question. I have 15 years experience in the design and development of software and hardware for military command and control systems. This includes ground sensor systems and environmental stress screening automated test equipment systems. Over the years I have programmed in some dozen or so odd languages in various environments. Currently I am employed as the Senior Engineer at a small contractor and manage a project team developing real-time sensor monitoring and analysis software in Ada using the lastest 32-bit Ada and C++ development tools targeting MS-Windows95/WindowsNT.

Why did you concentrate on Yaesu instead of the better Kenwood radios ?

Interesting question. I do not know what you think is better, they are all pretty much equal when comparing radio model classes. However, I have been a long time Kenwood user. My first new ever h.f. rig was a TS-520SE bought in 1980 at Radio Unlimited (long time defunct) in Somerset New Jersey. I followed that with a TS-930S from Trevose in Trevose P.A. in 1984. In 1992 I went h.f. mobile with an FT-890AT, and eventually made the mistake of bringing in the house and running

it with CT on an old '286 for a CQWW contest, that hooked me. From that point I was driven to design the best CAT program possible and I started with what I had, a Yaesu. I also own a FT-840, needed to replace that '890 in the mobile and found with Hustlers that I really didn't need the antenna tuner. I have recently purchased a TS-450S/AT also by the way.

I was wondering what class license you have and what your radio station consists of ?

Currently I hold an Advanced Class license. I started as a Novice in 1979. The main rig is a TS-930S with Nir-10 and with SB220, for search and pounch I use an FT-890AT barefoot. For VHF, we use an FT-736R with one each TE-Systems amplifiers on 6, 144, 222 and 432 with a mix of DX-Engineering on 6, M-Squared on 2 and 432 and Rutland Array on 222. I also use the Hy-Gain antenna system for my OSCAR work.

Why did you choose Visual Basic of all languages when C is the better choice ?

Another interesting question. Basic has served me very well over the years, except for system programming (you can do embedded in Basic!) it is a very good choice to rapidly develop an application. And since CATCC has been and will probably remain a part time effort, I did not and do not have the time to code everything in C. I personnally find Basic my prefered language for most programming chores, since time is always at a premium.

Can your software be run on an 80286 unders Windows 3.0 ?

No. CATCC requires as a minimum an 80386, preferably an 80386DX25 with 4MB ram and 15MB of free harddisk space, and at least 2 serial ports and 1 parallel printer port. Also a 1024x768 SVGA monitor is recommended. Optionally a Sound Blaster compatiable board and additional serial ports are desirable. Windows 3.1 with SHARE.EXE installed running under DOS 5.0 or greater is required for the operating environment. Obviously, the more CPU power, RAM and harddisk space the better performance will be.

I downloaded the CATCC_PR.ZIP file and did not find the CATCC software, what gives ?

The CATCC_PR file is a Press Release on CATCC with some sample programs that demonstrate some features built into CATCC. The programs in CATCC_PR are not complete applications, they are just toys. Look for the availability of CATCCjr on September 28th.

What is the difference between your CATCC and CATCCjr programs ?

CATCCjr is a stripped down version of CATCC, with the complete database engine (DX-dBASE(tm)) left out, and other major features reduced. CATCCjr will provide full radio control and DX-Cluster

support and WILL log, however, the logging will consist of writing to a CT compatiable .RES file. For users of logging software that import the .RES file the CATCCjr shareware/trial version may fit their needs without the need for the full CATCC software.

Why distribute the CATCCjr version of your software at all ?

I want to allow the Amateur community the use of the program so that they can provide me valuable feed back to aid in the development of the best possible application. I also feel that the thousands of users that find the trial version meets their needs should not have pay for features that they feel are not needed. Many amateur already have time and money invested in logging software, but CATCC is NOT just logging software, the CATCCjr version will make a very nice front end to someone that doesnt want to change their logging software.

Why are you putting another logging program on the market, there are so many now ?

While it is true that many good logging programs already exist, until now there has not been a really good complete CAT program that pulls all station capabilities together in a seamless integrated environment. I feel that CATCC will be THE program for Amateur station operation. It will not do everything that everyone wants in version 1.00, it may never do everything, but it is only just getting started, and so far everyone that has seen has had nothing but praise.

Why did you write CATCC when other good logging software exists ?

Because CATCC is not just logging software. It is an application that provides completely integrated station operation. No other software that I have ever heard about controls the radio equipment to the level that CATCC does. Not to mention the feature rich set of monitoring, alerting and real-time analsysis features if offers.

Does this program really exist ?

This question is popular. Yes, CATCC does exist, it is currently in the final stages of beta testing by a number users.

Is CATCC a DOS or Windows program ?

CATCC been developed as an event driven MS-Windows application.

What radio does it support ?

The current baseline supports all current and most recent manufactur Yaesu F.F. cat radios and has been tested using the Yaesu FT-840, FT-890, FT-990, FT-1000 and FT-736R radios.

Does your program work with Kenwood radios ?

Sample programs to prove the Kenwood code have been written and
tested on TS-440S/AT, TS450S/AT and TS-850S/AT radios to date,
and is currently being integerated into the CATCC baseline.

Pete
The tuner in the 450 is matching the rig and it's meter to the
antenna, but remember the antenna hasn't changed..Since the
external meter is on the antenna it will still read the antenna's
swr..which will not be the same as the internal swr meter before
the 450's tuner.

>that it will still attach properly to the FT-530?

Unfortunately, Yaesu packs are glued together. A method that works
pretty well is to throw it in the freezer for a couple of hours
then take it out and rap it sharply against the desktop. The glue
will have become brittle by the cold, and will usually part cleanly.
Once you've rebuilt the insert, just glue the pack back together.

Hi

I Have a Trio TR7010 2 metre ssb tranceiver Which is refusing to resolve signals the only clue I can come up with is V.hot AF power transistors .

I looked in to sending it off for repair but was told it would cost
£35.00 an hour plus parts and as the set is pretty old it really
wouldn't be worth the expence.

is this a common problem on this set ?

can any one maybe explain the fault to me and a remedy.?

it seems to me that the AF transistors are displaying a symptom and possibly not the cause am I right.

any help in repairing this set would be greatfully appreciated.

Thanks

: etc.

Yup, basically it's a piece of garbage. :-)

It's unstable, doesn't have enough power to transmit for more than
a few feet, and is prone to SEVERE microphonics.

I have an extra TS-440S laying around and I was wondering what a fair price would be for this rig? It was literally *never* used and comes with a power supply

Thanks,
Adam

: I have seen a very nice Kenwood that someone told me was around $700.
: Any recommendations? Please email me if you don't mind. Thanks...

Most HT's (walkie-talkies) nowadays have the out-of-band receive feature;
for 2m HT's, it's usually about 130-something to 170-something MHz. If you
need anything out of this range a 2m HT definitly won't do. Some
can be modified to transmit out-of-band too. I don't know about programming
30 channels to be scanned though. I know there are scanning features but
whether they scan programmed channels or the whole band I'm not sure.
